Professor E. W. Major said that was one of the happiest days he had known. He had graduated in Minnesota. Since he had come to California he had longed for a farm. At the university they had no livestock and he hoped, now that it was a farm, he would never have to leave California. It is pretty hard work to teach a man anything about livestock when you have only a second story and a picture of a cow.

The many talks or addresses were of great interest, and the dedication and institute was most successful.

Some of the papers will later appear in the Cultivator.

NEW CATALOGUES.

The Fresno Nursery Company is out with a fine new catalogue of deciduous and citrus trees and all kinds of grapes. It is illustrated with views of the office and Fresno yard and of nurseries and working force in the nursery.

Mr. Wilson has had long experience in nursery business and puts out fine trees and vines.

A NEW DEAL IN FARMERS' INSTITUTES.

It will have to be admitted that the system of farmers' institutes maintained in California has not been an unqualified success. The institutes have been worth all that they have cost and far more than they have cost in effort and in money, but they have lacked much of educating the farmers of California in what they most need to know.

There is in California, as elsewhere, a certain fatal self-satisfaction which prevents those who have it from keeping up with the times in which they live. This would prove fatal to any other occupation except farming. In manufacturing the owner who does not seize upon and use every new device, every trick in the trade, is soon forced into bankruptcy by the keenness of competition. In merchandising, failure to keep abreast with the times puts a padlock on the door, and ninety-five per cent of all those who go into merchandising come to that end, mainly from that cause.

California has surpassed other States in the fruit industry because the marketing of fruit got into the hands of enterprising men, who found out how to prepare the fruit for market in tempting ways, and thereby were able to meet competition that possessed every other advantage, and meet it successfully. They sold California pears in New York when New York pears were being fed to hogs for want of a market. The New York growers did not know how to market their product.

California is a long way from markets. One way it has to cross 2000 miles of arid America to reach the threshold of a market, and the other way 6000 to 8000 miles of ocean. Unless its products are handled in the best possible way they cannot reach markets at all. Again, California does not produce staples so much as luxuries, and her line of production must be in the direction of highly specialized and intensified agriculture. The rule of thumb will not win such results in California, with its specialties and novelties, as in the Mississippi valley, with its staples of hogs, corn, beef, wheat and hay.

And yet it is precisely in those States of the Mississippi valley that farmers' institutes have proven most successful. They are held in every little hamlet and are largely attended. They do not cover as wide a range of subjects as do our own institutes, but they get down closer to the problem of an increase of productive power, and in a way that makes the farmer know that the institutes mean dollars to him.

There is reason to hope that the university extension idea of popular agricultural education will bring the farmers' institutes closer to the farmers of California, and, in bringing the institutes closer, they will bring the university closer to the people. That, too, is important to both university and people. Farmers are skeptical of the value of the knowledge of professional men until they are brought face to face with that knowledge in practical ways, when seeing becomes believing.

California has stood by the institutes as liberally perhaps, as the interest justified, but with increased interest there will be an increased demand for support for the institutes, and that support will be forthcoming. In the new deal for the farmers' institutes in California The Union sees hope of progressive educational work. — Sacramento Union.

Coulson's Improved Mash Egg Food

Takes
Less
Feed

Makes
More
Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of **COULSON'S NO. 3 CONDITION POWDER** will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time they must have the best food you can give them from the commencement of the molt. You will find **COULSON'S IMPROVED MASH EGG FOOD** is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-Pound Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

COULSON'S IMPROVED MASH EGG FOOD is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect **COULSON'S IMPROVED MASH EGG FOOD** shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Manufactured by

Coulson Poultry and Stock Food Company

Petaluma, California

Germain Seed Company, Distributing Agents, Los Angeles, California

50 Cent Eggs

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Erinose.

I am sending a leaf of Mission grape, which seems to be infested with some kind of fungus. What is it and what is a preventative?—It seems to be spreading.—W. A. Bain.

The grape leaf sent in by one of your correspondents is affected by an insect trouble, known as 'erinose. This is caused by a very small minute insect, a species of mite, which attaches itself in spots to the underside of the leaves and causes the peculiar growth seen in the specimen.

Another similar case is often seen on walnut leaves, which are affected by an insect of the same kind. Bulletin No. 136, of the Experiment Station at Berkeley, is devoted to the subject of the erinose of the vine, and treats the matter fully.

No serious injury commonly results from the attack of this insect, and the trouble is not usually considered as one requiring any treatment. It is very common all over the State in vineyards.—Ralph E. Smith.

Frozen Walnut Trees.

Last winter some of my walnut trees were frozen to the ground almost, and shoots have grown out from the trunk. Have cut away all but one, but my trouble is that the trunk has died on a slant. Would it be best to chisel or cut away all the dead wood until I have reached the green growth of bark? If let alone the trunk would rot. I allowed the old trunk to remain so that I might tie the new growth to it. I haven't watered any this season and hope to avoid the effects of frost.—H. S. T., Lordsburg.

It will be best to cut away the dead wood as you suggest, though if cut to within one-half inch of the live bark it will be close enough, and will probably be safer than to cut closer, if the work is done before the tree begins to grow in the spring.

If you will whitewash the trunks of the trees and also well up into the branches it will act as a preventative to the starting of the flow of sap in the winter, if warm days come. This flow of sap sometimes sours and causes the tree to die back as if frozen when cold weather follows.—J. B. N.

A Good Cow.

I have a cow that dropped her second calf in October, 1905, since which time she has been milking continuously. From September 1, 1906, to September 1, 1907, she gave 3093 quarts and is now giving 6 quarts a day. She is due to come fresh the first week in December. Old farmers tell me I should dry her off and give her at least six weeks' rest. Is this in accord with the idea of up-to-date dairymen? If not, how long should she rest. W. P. RUSSELL, Claremont.

It is too late to dry off this cow safely. There is a drop in milk for a few milkings at about three months before calving time; then is the time to dry the cow off slowly so that she is completely dry six or seven weeks. If you dry her now it will make trouble, as the new milk will begin to swell the udder before the secretion of the old milk has completely stopped. This nearly always brings on garget. Milk and feed this cow

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

to carry her over the time. Feed bran freely as it is cooling, and just before calving see that the bowels are well moved, if then not loose.

Milking Machine.

Is there any milking machine just milking one cow at a time. If so please let us know the address through the columns of the Cultivator.—S. B., Modesto.

The foot-power machine which advertised in the Cultivator by the O. J. Weber Co., of Los Angeles and the Steiner Co., of Berkeley, is for two cows at the same time, but one side may be closed, and only one cow milked at a time if desired.

Bleaching Nuts.

Is the bleaching of nuts prohibited?—I. W. M., Escondido.

We know of no prohibition, that is so far as the pure-food law is concerned. The chloride of lime process is covered by patents so that royalty is demanded now if the process is used. Many walnut growers are now using the sulphur bleach.

Compelled to Dip.

Will you please tell me whether there is a law in this State compelling people to dip their cattle in order that the Texas fever tick may be done away with. W. M.

There is a law providing that when the State Veterinarian finds any cattle infected with Boophilus Annulatus ticks he is required to notify the owner or person in charge of said cattle to dip or otherwise treat said cattle for the purpose of eradicating such tick.

Ferrets.

Where can I get ferrets? W. S., Turlock.

We do not know whether they are bred in California or not. New London, O., is the great ferret center of this country. H. M. Messenger of that place can give information.

Olives.

Kindly name the olives which are mailed under other cover. They are from Big Springs ranch near Hemet.—W. J. P., Hemet.

The green olives are Oblonga, they are, so far as one can be positive, of varying conditions and sometimes of the same tree—so that no one can positively identify without knowledge more. The ripe olives have been submitted to olive growers, and owing to their being shriveled and of shape on arrival, we have not been able to get any to whom they were submitted to hazard a guess.

The Oblonga is a fine olive and worthy of further cultivation.

Trouble With Cow.

What can I do for an extra good heifer having one calf. She comes around regular every twenty or thirty days, loses on her milk each time for two or three days. The animal is all right in every way I am sure. In three or four days she throws blood and does not care to eat as hearty as she does at other times. Can anything be done to remedy this condition? A. R. G.

Yeast treatment will probably

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

ring this cow all right. When she
ext comes around take a cake of
ny of the commercial yeast and set
with either potato or flour, when
is light add a pint of warm water
nd strain it. Inject into the cow's
agina, after twenty-four hours
reed her.

arlic.

Would a sandy loam be good for
ising garlic and how is it planted
nd what time is best?—Subscriber,
windale.

Yes, sandy loam is ideal land for
arlic. It is of the easiest culture,
rowing freely on any soil suitable
r onions. It is propagated from
lvision of the bulb called "doves"
r "sets." Plant in January or Feb-
uary in rows one foot apart and
pur to six inches in the row. It
akes four to five months to mature,
nd is harvested like the onion. Al-
rays sold in the dry state. If Los
angeles seedmen do not handle the
ets I think they could be procured
n San Francisco. If Subscriber in-
ends to grow them for market, as
wants to be sure of his market, as
he demand is limited to foreign
opulation. If he wishes only to
row for his own use, it is another
matter, and he could use some of the
product in the green state, as with
onions.—Q. A. L.

IMPORTANT MEETING.

A general meeting of the River Im-
provement and Drainage Association
of California is called for Monday,
November eleventh, 1907 at 10 a. m.
at the headquarters of the associa-
tion in California building, Union
Square, San Francisco.

The members of the "California
delegation to Congress will be pre-
ent. The principal object of the
meeting is to present to the Con-
gressional representatives the views
of the people regarding the assist-
ance that is desired from the Federal
government to improve California's
waterways. You are urgently re-
quested to be present.

The general public is invited to at-
end the meeting, which promises to
be of great interest and importance.
Simultaneously with the meeting

street, Los Angeles.

of the River Improvement and
Drainage Association other matter
pertaining to California's interest
will be presented to the Congres-
sional Delegation, and it is hoped that
all those who have something to
present will do so at this time. The
members of the delegation are very
glad to receive suggestions from the
people of the State, and at this meet-
ing a good opportunity will be given
to discuss all matters in a most thor-
ough manner.

COULD NOT DO WITHOUT IT.

We are greatly pleased with your
paper and could not do without it.—
A. Banlin, Headlsburg Sonoma
county.

Satisfaction

Is a Very Essential Feature
When You Are Buying Furniture

Do not buy furniture because it is offered
on special sale at apparent great savings.
If the reductions are genuine the quality is
usually inferior and seldom gives satisfac-
tion. Consider carefully the quality, style
and making. It is the long use that tells
the story. Furniture is not bought for one
or two days' use. It is to be associated with
your home for years and if it is not well
made, good substantial furniture it will
never give satisfaction.

Prompt delivery in perfect condition.

EVENING PRAYER.

"The day is ended. Ere I sink to sleep
My heavy spirit seeks repose in 'Thine;
Father, forgive my trespasses, and keep
This little life of mine.

With loving kindness curtain Thou my bed,
And cool in rest my burning pilgrim feet,
Thy pardon be the pillow for my head,
So shall my sleep be sweet.

At peace with all the world, dear Lord, and Thee,
No fears my soul's unwavering faith can shake,
All's well whichever side the grave for me
The morning light may break."

HOW HE GOT HIS NEST EGG.

WHO does not remember some schoolmate who was antagonistic? Morgan Enright was so to me. He was two years older than I, and until we were respectively seventeen and fifteen he tyrannized over me. At fifteen I was fully as tall as he, though not as well developed. At any rate, I gave him a good thrashing, and that ended his annoying me, though his ugliness toward me was increased.

When I began to earn a living I was attracted by the large sums paid to divers and became a diver. The truth is, I was in love, and being anxious to marry, chose that which promised to enable me to secure a nest egg. My sweetheart didn't approve of my occupation at all, but like me, wanted the nest egg. However, I had a mother to take care of, and the nest egg failed to appear. I was pretty well discouraged, when something happened that very nearly rendered it unnecessary.

A ship had gone down close to shore on which there was heavy insurance. A diver was to be sent down representing the underwriters, together with one representing the owners and the captain. I was chosen to represent the underwriters. I was standing on the float in diver's rig, all except the helmet, waiting for the owner's diver, when a boat pulled off from the shore, and when it came near enough who should be in it but Morgan Enright. He was as much astonished to see me as I was to see him. Neither knew that the other was a diver, much less that we were to go down together, but we were boys no longer, and I offered him my hand. He took it, but the look on his face froze the marrow in my bones—a look that I did not fully understand till later.

Well, we struck bottom about the same time on a stretch of white sand. The ship was in a good position for inspection, for her bow had come down on a ledge of rock that lifted it above the sand and only a few feet above our heads. It was no secret that I was there to look for foul play, and the place to find it was on the ship's bottom. I walked along, looking upward, till at last my head was even with the inclining bottom, and after that I was obliged to stoop. Enright accompanied me, also looking. He soon got ahead of me and motioned me to come on, shaking his head as if to say that he had been looking carefully where I was hunting and had found nothing. I looked all the more carefully and at one place, poking my finger in an

indentation, found a hole. I succeeded in pushing my fist through the bottom and into the ship. Enright turned back and saw me stooping, with my arm thrust into the hole. He came up to me and the first thing I knew seized me around the body and gave me a wrench that broke my arm. It occurred to me at once that he had been sent down by the owners to foil an attempt to discover, or at least report, on the scuttling of the vessel. Quick as a flash of lightning all that had passed between me and him from the first blow he had given me before I was old enough to protect myself till the day I had thrashed him came up before me. And now he was to take his revenge fifty feet under water. He was to kill two birds with one stone—have his revenge and prevent my reporting the scuttling of the ship.

Realizing that, handicapped as I was, I would be no match for him in a struggle, I pretended to faint and sank down on the sand. He raised his heel and brought it down the glass over my face, but its thickness, together with the resistance of the water under his foot, saved me. He failed in the attempt. Then he took a knife from his pocket and cut the signal line. He was too late, for I managed to give the signal to be raised. When he saw me rising he cut the rope that was lifting me, and I sank again on the sand. Then seeing that I was cut off from succor he gave the signal to be taken up. As he was rising I saw one chance for my life. Encircling his leg with my sound arm. I clung with the strength of despair. Had he been above water he might have shaken me off. As it was, he was unable to do so. The men above feeling the extra weight pulled hard, and before my enemy could do anything to prevent we were both at the surface.

As soon as I saw that I was saved I fainted. When I came to myself Enright had gone, but, turning my eyes toward the shore, I saw him pulling for the dock with furious strokes. Hurriedly I called on those standing by to stop him, and two of them, entering another boat, reached the dock in time to prevent him from getting away.

When the underwriters heard my story they resolved to push both the owners, the captain of the ship and especially Enright to the wall. They had no end of money with which to do the job and landed every one connected with the swindle in state prison. The courts couldn't hang Enright, as he deserved, because he had not succeeded in taking my life, but the judge gave him twenty years, and he still has ten of them to serve.

That was my last trip under water. No man could get me to put on a helmet for any money, but it has not been necessary. I had saved the insurance to the underwriters, coming within an ace of losing my life in doing so. They made up a purse for me, each putting in \$2000, and as there were seven of them you can figure that I got my nest egg. Besides, I have been in their employ ever since. I was married that autumn and have lived comfortably on my salary and the interest of my capital, which has been steadily growing.—Harold Otis, in Denver Field and Farm.

COTTAGE OR "DUTCH" CHEESE.

The manufacture of cottage cheese on the farm can be carried on very extensively and some profit can be derived from it if it is properly made. It is put up into neat packages. The milk does not have to be used, but skim milk can be used in every case. The advantage in using skim milk is that a lot of the butter fat can be saved which would surely escape into the whey. By using skim milk all this fat can be saved and afterwards added to the cheese and improve the quality of the cheese to a great extent. In fact, the present grades of cheese can be improved by simply regulating the amount of cream added. This addition of cream to the cheese entirely changes the flavor of the cheese.

Twenty-four hours before the cheese is to be made, the skim milk should be set in a warm room having a temperature of from 60 to 70 degrees. A starter should be added to this milk to insure a proper degree of acidity. If a starter is not added, undesirable bacteria are apt to get into the milk and thus spoil its flavor to a great extent. Even if the room in which the milk is being soured is perfectly clean, the undesirable bacteria are still liable to get into the milk, for these bacteria exist in the atmosphere and wait for just such a chance to multiply, and they surely will very rapidly after they once get there. An artificial starter may be used, but this is not absolutely necessary.

A good starter is prepared by taking a little buttermilk forty-eight hours before the cheese is to be made, mixing it up thoroughly with a little skim milk; in twenty-four hours this starter will be ready to be put into the skim milk to be turned into cheese. Warm the skim milk to about 65 degrees. Within twenty-four hours this milk should have a mild acid flavor and be thickened. The proportion of starter should be about five per cent of the whole amount of the skim milk used. Good success can also be obtained by using simply pure butter milk as a starter, but the operator will have to watch very carefully to see that the butter milk used is not too sour, for it will make the cheese taste too strong; on the other hand, a mild, sour taste in the cheese is desirable.

When the milk is fully ripened, heat it very slowly to 90 degrees and keep it at that temperature for about an hour, for the curd will take a long time to heat through thoroughly. Stir the milk slowly during the whole time that it is being heated so as to have the whole mass heat evenly. After this has been accomplished drain the cheese with cheese cloth until the whey stops dripping.

Mix enough salt with the cheese to suit your customer's taste if you know what it is; if not, suit your own. Work the cheese a little while mixing the salt until it is a trifle salty; then add as much cream as the price that can be obtained warrants. Some customers will pay a higher price if more cream is added. Put the cheese into small balls and wrap it up in regular butter paper. This will make a nice appearing package which will greatly facilitate the sale of the cheese and improve the price. A much higher price can often be obtained from the use of skim milk by making it into cheese and by feeding it to live stock.

SAUCES FOR PUDDINGS.

Hard Sauce.

One cup powdered sugar; one-half cup butter.

Beat the butter well, then stir in the sugar and beat to a cream, flavor to suit the taste.—Mrs. W. J. B.

Cream Sauce.

One-half cup butter; one cup sugar; one-half cup milk or cream; one teaspoon flavoring.

Cream the butter, add sugar gradually, beating all the time; add milk or cream gradually, then flavoring. Beat until very smooth and creamy. Serve.

Every-Day Sauce.

Two tablespoons butter; one cup sugar; one tablespoon flour; pinch of salt; one scant pint boiling water; three tablespoons cold water.

Beat the sugar and butter to a cream, add the flour and thoroughly mix. Then add the salt and cold water, then the boiling water and let it boil a few minutes; after removing from the fire, flavor with vanilla or almond.—Mrs. A. M. W.

Lemon Sauce.

Three-quarters cup of sugar; one egg; one-half cup butter; one lemon; one teaspoon nutmeg; one-half cup boiling water.

Cream the butter and sugar and beat in the egg whipped light, then add the juice of the lemon and half the rind—grated; also the nutmeg. Beat hard, then add the water, cook in double boiler till it thickens.—Mrs. E. R. S.

Nutmeg Sauce.

Half a coffee cup sugar; butter, size of hickory nut; one tablespoon flour, rounded; few drops vanilla; one-half teaspoon nutmeg, scant.

Mix butter, flour, sugar and nutmeg together. Dissolve with a little cold water, then pour on one pint boiling water. Stir well and cook about 10 minutes. Just before serving add vanilla.—Mrs. G. B. D.

HOMELY HINTS.

Keeping Silver Bright.

Both silver and plated ware should be washed with a sponge and warm soapsuds every time they are used, and wiped dry with a clean, soft towel.

When dried, if the plate is not bright, rub with a chamois or take a little whitening and add to it a few drops of spirits of wine or gin, making the mixture of the consistency of good batter; rub it on the plate, dry with chamois.

A brush should only be used for the embossed work.

Plated articles should not be left damp for any length of time, as they are liable to injury. After forks and spoons have been used for eating vinegar salads, pickles, eggs, etc., they should be cleaned immediately, and this can be done by rubbing the spoon or fork with salt between the thumb and forefinger.

Plated and silver ware need constant care. Cleaning once a week with whitening or plate powder is, as a rule, as often as is necessary. Another good powder for cleaning silverware is composed of two parts of whiting, one part of white oxide of tin and one part hartshorn. Each article must be reduced to a very fine powder and then well mixed. If the plate is laid away any length of time after use it should be rubbed with a little spirits of ammonia and water, and afterward rinsed in plain water, to destroy the corroding effects of any salt that may be left on the surface.

Markets

LOS ANGELES, Nov. 6, 1907.

Butter.

The slump in butter continues its downward course, showing a further decline of 7½ cents during the week. This is over a 12-cent decline in the two weeks past.

There is nothing special on the butter market, as the exchange closed yesterday out of respect for Mr. Allaway, who was murdered in Chicago, Monday. Mr. Allaway was a member of the exchange and head of the large butter firm of Allaway & Layton.

PLANT EUCALYPTUS.

The tree planting--forest tree planting--fever has struck California. Careful observers have for years watched with concern the destruction of our forests and this concern has finally begun to affect the mass of land owners and possibilities of great profit is causing extensive plantings.

"Where can I get the trees?" is being asked on all sides, and it is with pleasure that we refer to one of the oldest eucalyptus growers on the Coast. It is W. A. T. Stratton of Petaluma. He has a nursery experience of over 40 years; can grow fine trees and will send a booklet on when and how to plant.

He has a couple of hundred thousand trees on hand.

SHORTHORN CATTLE SALE.

Next week will be Shorthorn week. Two big sales are announced.

On Wednesday, November 13, the Howard estate offers a large bunch of exceedingly fine stock at the ranch of Newman. This is the second annual sale and is to be a regular feature of this large ranch. Fifty cows and heifers and 25 yearling bulls are to be sold.

At the close of the sale a special train will run to Woodland where the second annual sale of the Roselaw and Enterprise herds will be held. Mrs. W. B. Gibson's place. Both the Gibson stock and that of Mr. H. P. Eakle is fine stock.

These great sales should attract stock lovers from all over the State.

CONGO ROOFING

Congo Roofing is a strictly high-grade ready roofing. Experience and tests show that neither weather nor climate has any effect whatever upon it, and consequently Congo Roofs last almost indefinitely.

It is easy to lay. No special tools or skill required.

Congo can be used on any kind of roof. If your old roof needs attention, put Congo right on over the old roof and make it serviceable for many more years.

To further substantiate our claims for Congo, we will be glad to send *Sample Free* upon request.

Citrus Market

LOS ANGELES, Oct. 5, 1907.

The new citrus year opens with fairly liberal shipments. Under present financial conditions none can predict with certainty, but the outlook for good citrus prices is favorable. The fruit is fine.

The fruit so far shipped is entirely from the North and Central California. About 20 cars have already been forwarded.

Lemons are not strong in tone, though fair prices are yet received.

Shipments.

The shipments from Southern California for the year ending Nov. 1st, aggregated 23,986 cars of oranges and 3507 cars of lemons. To this should be added about 2000 cars from the Tulare county sections.

A MAGNIFICENT STORE.

In an article on "Los Angeles as a Jewel Center," The Travel Magazine, of New York, says:

"A few years ago the jewelers of Paris were supreme in their line of handicraft. It was in that city that what is known as the "modern style" in jewelry—a kind of back-to-nature idea—had its inception. But Los Angeles enterprise and imported skill, copying first from the French and afterwards originating along new lines, is achieving for itself a place of recognized importance.

Some of the rarest precious and semi-precious stones of the world are found within a radius of two hundred miles of Los Angeles, and this city has some of the largest and best lapidary establishments to be found anywhere. In them are engaged as designers men of the highest artistic achievement. Los Angeles already invites comparison with the cities of Europe."

Of these fine shops the finest—the wonder of all, is the one of Messrs. Brock & Feagans, which is to be opened next Monday and Tuesday, Nov. 11 and 12.

Every visitor to Los Angeles should make make a visit to the store. It's a wonder.

In these days when progressive farmers are hurrying to provide themselves with labor saving powers, the line offered by the International Harvester Company, of America, should not be overlooked. Buying one of these engines is buying dependability, and that is the first consideration. And you have the highest assurance that every other gasoline engine requisite is included. There are quite a number of styles and sizes, so that every possible requirement is met. You know to begin with that if anything should not be right it will be made all right. Read the International advertisement elsewhere if farm power interests you.

Does this stream of water look good to you?
 It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs. It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.
 How many pump users can say this?
 It shows conclusively that it pays to install good machinery.
 We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.
 Mail us a card asking for it today.

Coulson's Improved Mash Egg Food

Takes
Less
Feed

Makes
More
Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of COULSON'S NO. 3 CONDITION POWDER will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time they must have the best food you can give them from the commencement of the molt. You will find COULSON'S IMPROVED MASH EGG FOOD is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-Pound Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

COULSON'S IMPROVED MASH EGG FOOD is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

California's Live Stock Possibilities

Mrs. Sherman Writes of the Various Lines of Live Stock and the Advantages for That Industry on This Coast

THERE is nothing small in California. Speak of river, hill, valley or mountain and always come back the loyal reply: "Largest and finest in the world." The stock raising interests are not exceptions to this rule. In the days of range feeding, one firm could easily drive their cattle from Arizona to San Francisco and feed every night on their own lands. The ranch feeding of cattle has proven more profitable than the range way of rustling for a living on the low bushes between "grass and grass." The range appeals to the love of the picturesque. The cowboys were better men than the Eastern writers of fiction depict, as they dwell on only the vicious ones that delighted in "painting the town red."

But cowboy days are going as to the greater part of the State. The smaller ranch and the thoroughbred are coming. We are not on the Eastern "general farm" basis, for California is a State where specializing is popular. So the stock industry has every prospect of accomplishing still greater things than ever in the past.

With this State's vast importations of live stock, and still more of meat products, there is the greatest urgency that this industry receive the utmost encouragement that this drain upon our resources may be stopped and these millions be kept at home.

Cattle Ranching.

The plains have herds of Hereford and Short-horn grades on the salt grass and alfalfa pastures. The alfalfa is cured into hay and fed during the rainy season to the herded cattle. Some of the thousands or more acres of wheat farms are now converted into cattle ranches and grow enough grain for winter feeding. The stock run on the wild grasses and alfalfa during the summer. In the off season they are fed on chopped alfalfa and barley hay. While on Coast ranges the cattle find the seasons of growing grass lengthened by the sea fogs, yet the cattle are gathered in and fattened in large numbers on the sugar beet waste. The range cattle are increasing rapidly in the interior, now that portions of the forest reserves are open for summer grazing. The foothills furnish winter feeding and the higher mountain meadows for the summer. The small cattle men's holdings herded by the picturesque nomads are now to be found on the mountain roads of the high Sierras.

Capital.

The beef cattle industry requires capital for the business is profitable when cattle are handled by the car or trainload lots. A man with a small bunch of steers has little chance to sell them, except at reduced rates. Often these smaller men combine and open for a time a small butcher shop dressing their own steers. They are often forced out of this business by the cut rates.

Some of the men that own the great cattle ranches are wonderful in their attention to detail. I know of one that now in his old age can

count out a bunch of steers quicker than any of his employees; tell how many of them will make feeders at once and about what they weigh, all the while the cattle are being rushed by on a run.

Dairy Cow.

The dairy cow is the poor man's dependence. Add the pig and a good living is assured on less capital than any other investment in California at the present time. Dairying also, offers to women of small means an independence.

The large dairyman is troubled over the poor-ness of his milkers. The pure bred cows of the large herds are often so poorly milked that they pay little more returns than the common grade cows, but the owner that milks his own cows is now realizing from \$6.00 to \$10.00 per head a month for butter fat. The hopes of the large dairymen centers around the improving of the milking machines.

A large part of Southern California output is absorbed by Los Angeles milk and cream trade. Even the dairies of the San Joaquin valley are called upon for a part of the cream besides much butter. Even then tons of butter are weekly shipped in from the East.

San Francisco finds the dairies of the great valley and of the north coast counties insufficient, and it, too, calls upon the East for more.

Why doesn't California keep all this outlay for butter at home?

Well, why?

Swine.

With the dairy naturally goes the "mortgage lifter." California's all the year growth of alfalfa makes it the ideal condition for growing of pigs. Grain for fattening is higher priced than the Middle West farmer has to pay, but other conditions are still favorable and the hog raiser has made money.

Berkshires and Poland-Chinas are the favorites, yet Duroc-Jerseys, Chesters and Tamworths are in evidence. Razor backs or "just hog" stock are conspicuous by their absence.

The future has great promise. Let California farmers accept the promise.

Horses.

California is famous for its stables of racing horses—as famous as Kentucky—only we have so many other things equally famous that we do not find time to tell people that we have "the best horses in the world." The small farmers have bred many standard horses in hopes of a winner. The amount of money spent on trying in the race track to go faster has not been to the betterment of the human family, nor to the betterment of the horse, as a practical animal. The racing blood sacrifices everything to speed. The horses are often light limbed, ewe necked, cat-hamned and flat-ribbed; beauty and form sacrificed to the ability to "go." There is little money in these horses for the small man. Even the great stables at Palo Alto were not a financial success.

Carriage Horses.

In California a high type of carriage horse is rare, only a few are to be seen in the larger cities. The same is true of all the United States. The government has now a horse farm in Colorado and is breeding towards making an American carriage horse. One of beauty, stamina, level-headedness and some speed. This movement has not come too soon for after twenty years of trying to breed from the trotting mares by the French and German Coaches stallions has been found not to give a high class of colts. The English Hackney was soon discarded as he was not quick or intelligent enough.

At Present.

The carriage horses of today are happy accidents, culled out of a mass of misfits. The large standard bred horse, particularly the blood of old Electioneer, gave size and style. A carriage horse must weigh not less than 1200; not be under 16 hands in height. Good looking and well broken to autos and electric cars a span of these horses finds ready sale at \$500 to 1000 dollars a pair at the ranches. Afterwards they are often resold by the jockeys for an advance of twenty-five to fifty per cent.

Draft Horses.

I believe that draft horse grades are the most profitable for general raising; they are hardy and require little care to raise, and no fixing up for the market. The prices at present are away up, but I have never in twenty years failed to find a ready sale for all I have raised. Span of

horses that weigh 1600 and over apiece, sell readily for 500 dollars or more a span, while the nineteen hundred-pound horses will readily bring twice that price. The grade drafter that falls under these weights finds ready sale as fire engine or heavy express horses.

Sheep.

The profits of sheep raising are again large, but the old days of free pasture has passed forever. Sheep on a water shed are the horrors of every forestry and irrigation student. The great flocks are gone that used to feed in the vineyards every fall. The fields of the rough foothill ranches that in former years were used for cattle are now turned into sheep pastures. The tendency to raise too many sheep on a limited range brought great suffering when a series of dry seasons came, the flocks died off like flies. The number of ordinary sheep will decrease, but the fine wools and even thorough-

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Walnut Planting.

Kindly advise through the columns of the "Cultivator," as to the proper distance for planting French walnuts grafted or budded on the California black.—J. A. K.

Walnut trees should not be planted closer than 50 feet apart in an orchard where the soil is good, though it will pay to set 60 feet apart with a walnut tree in the center which can be taken out when the trees begin to crowd. This is not likely to happen until the orchard is 15 years old and by that time the interset trees will have done a great deal towards paying for the orchard.

The French varieties are shy bearers in the southern part of the State, and if there are no trees of this variety that are in bearing and doing well near you, we would hesitate about planting many.

If you take buds, or scions, from the best bearing and most blight-resistant trees to be found in your vicinity and bud or graft into the desired stock, you will have a better orchard than to take varieties that are not tested. There are always a few trees in an orchard of seedlings that are better than any of the other trees, and by propagating from these you will have an orchard that will have every tree equal to these. If you do not already know of these trees go through the orchard at once and mark them so they will be known.

Glanders.

I have a sick two-year-old mule. She took sick six weeks ago with a very lame left hind leg. Two weeks after the lameness set in she commenced running at the nose and has been running at the nose since. She has become very poor. Her legs swell and she breathers hard. Is it distemper or something worse and what is the cure?—O.

Your horse has glanders; have him destroyed as soon as possible.—Dr. Oliver.

Asparagus, Celery, Cabbage Culture.

Will you kindly give me what information you can regarding the culture of asparagus, celery and cabbage. I have asparagus plants about eight inches high come up from seed planted in the spring. Should I transplant while they are growing or wait until later in the year? I planted some two years ago and where roots were one year old transplanted in ditches a foot deep, but they were not a success. I worked the soil fine and put considerable fertilizer on same.

When should cabbages be planted to be ripe in midwinter? I have large plants now. About when would they mature if transplanted soon?

How shall I transplant celery; have considerable in thick rows now about a foot high; will it be saleable if left in this state? Kindly give me what information you can and oblige a California Cultivator subscriber.—B. A. M.

Transplant the seedling asparagus in January or February. Set them out in rows three feet apart and two feet apart in the row. The ground should be very rich by plowing in large quantities of stable manure. One hundred tons per acre would be none too much. Six inches below the surface is plenty deep for the crowns, and they should be covered

only about two inches until after they have started into vigorous growth, when the soil can be gradually covered over the crowns.

Cabbage requires four to five months to mature, depending upon the variety and the skill with which it is grown. Ground should be very rich for good cabbage. One of the secrets of success in growing good cabbage is to see that it receives no check in its growth after it is once set out. This check often comes through lack of irrigation at the proper time or neglect in cultivation. Be sure that you have good seed.

There are several ways of transplanting celery. The most common one is to transplant into rows that are three or four feet apart and set the plants about six inches apart in the rows. I fear plants eight inches high will be difficult to transplant, especially if they have been grown closely together. I used to grow many thousand plants annually for the market and always practiced transplanting the little seedlings into a bed of very rich soil, setting the plants about two inches apart in rows four inches apart and transplanting from this bed into the open field. While this method seemed to involve a good deal of labor I found it profitable, for it gave me extra fine stock, well rooted plants, that were sure to grow, and it enabled me to throw out all weak and unprofitable plants so that almost 100 of those put into the open field could be relied upon to make a saleable stock. I have practiced another method of growing celery in a smaller way that was very satisfactory. Set the plants out in very rich soil seven inches apart each way, and fix your soil so that you can flood it with water at will. Planted in this way the plants will assume an upright growth and will blanch perfectly because the light is excluded by the dense growth. The outside row will have to be protected by setting up a wide board 12 or 14 inches wide entirely around the bed.—Q. A. Lobingier.

Pruning the Dewberry.

Will you kindly inform me which is the best way of pruning the dewberry vine? A year ago I read in the Cultivator about letting all the new growth alone during summer and also another recommending keeping the new growth off. One correspondent was from Austin, Texas; the other was from Southern California. I followed the Texas idea, but found the new growth was in the way of picking berries, and the thought came to me, if it is not a better plan to put the strength of the vine in growing berries instead of so much foliage. Some of my vines are eight feet across. I noticed some of my vines the leaves shriveled up, kept green, but were curled up to about one-third of their natural size. Hoping to hear from some of your correspondents who are growing dewberries which way they think best to prune their vines. Also how to treat the vines which seem affected with some blight.—I. M.

For the Gardena, or Lucretia varieties, the plan of cutting off all the new growth before the crop gathered, is not the best one. A plants require abundant and health

foliage to mature fruit. I cut out only enough of the new growth to enable the pickers to get at the fruit. It is also too late now to cut off all growth, both old and new, and allow the new growth to come up and make the wood for next year's fruit. That must be done just as soon as the crop is gathered, in order to allow the new growth time to grow canes sufficiently strong for next year's crop. If J. M.'s vines are eight feet across they should be cut back to three feet and in January all the old canes should be cut out. I have never seen very good results in Southern California with dewberries without irrigation. Bordeaux mixture sprayed on the vines early in March will be the remedy for blight.—Q. A. Lobingier.

Best Variety of Strawberry.

Will you kindly tell me what is the best variety of strawberry plants to set out and when the proper time to set them?—E. H. D., Hemet.

We have tried over 30 varieties of strawberries and have found the Brandywine the only one that is profitable on our soil. There are other varieties that seem to do well in special locations, but the Brandywine does well everywhere, if they get reasonable care, and you secure plants that are properly grown. We consider February the best time to plant.

Some of the people here tell me that the vines of dewberries and blackberries should be cut level with the ground and that the cutting should be done just now. Could you kindly say through the medium of the Cultivator, if the cuttings out of all canes at this time of the year, is the proper thing to do.—T. L.

See Mr. Lobingier's reply to I. M. in this issue.

Pansy Seed.

At what time can I sow pansy seed and what is general method of culture?

Sow pansy seed from September to January. Last year I sowed my seed early in September, in boxes of nicely prepared soil, and when they showed the third leaf I transplanted them into similar boxes of very rich soil about two inches apart. When they had grown so that the foliage about covered the soil in the box, I transplanted them into a bed I had prepared on the lawn, putting them one foot apart each way. The bed was 16x40 feet with oval ends and held about 500 plants. They began blooming about December first and were a constant delight until the first of July. After the plants seemed well established in the bed I covered the ground between the plants with manure from the dairy corral, to the depth of two to three inches, first passing the manure through a screen to take out all lumps.—Q. A. L.

Calla Lilies.

I came from the East two years ago where in the fall all flowering plants had to be lifted on account of the cold. Since coming to California, I have a row of calla lilies and I hardly understand what treatment they should have. They bloomed freely last winter, then the leaves dried off and though they have had plenty of water have not started again. Should I have taken the bulbs from the ground when they quit blooming? Should they be divided this fall? Do they need a fertilizer? I also want to ask about a strawberry bed I have. I had two dozen plants given to me in February, but didn't have the place ready I wanted for the permanent place, so set them in a row along an irrigating ditch.

They have now begun to vine. Can I move them this fall and have fruit next year or is the fall the best time to move them? Should I wait till spring; would you answer in the Cultivator?—G. T. L.

Without seeing the plants, it is difficult to say first what is wrong. They should not even have died down if water was not withheld. Gophers sometimes work havoc with bulbous plants and may have destroyed the bulbs, thus causing the plants to die. Examine, and if the bulbs are there and sound, they will surely come into growth.

Leave your original strawberry plants where they are and you should get fruit next spring. Get your permanent bed ready so that you can set out these young plants in February. Set them in rows 20 inches apart and put the plants 8 to 10 inches apart in the rows. Keep all runners off next summer. If you have more young plants than you need for your new bed just leave them where they are and they will give you considerable fruit provided, of course, they are a good variety and your plants were not taken from exhausted bearing beds.—Q. A. L.

Carnations.

How and when may I propagate carnations from cuttings?

If only a few are wanted, take off vigorous shoots in December or January and plant them four to six inches deep in good soil, or where they are to grow.—Q. A. L.

The above replies of Mr. Lobingier, have been delayed by his serious sickness. We are glad to have him back again.

Blight or Bacteria.

The leaves on our young walnut trees, planted last spring, turn brown at edges, curl up and fall off. Please name disease and suggest remedy.—P. L.

Walnut blight or "bacteriosis." There is no known remedy.

RENDER CAESAR.

The Cultivator recently contained the following:

"A very simple and practicable test was made at the State Polytechnic school at San Luis Obispo of 158 hens. The test was made as follows: An attendant watched the hens for three days, and out of 158 only 65 were found on the nest during this time. This left 93 that had not laid for three days and were taken out and placed in a yard or yards by themselves, while the 65 were yarded by themselves. All were given the same care and feed and a close record kept from October till March. The 93 showed a net profit of only \$6, while the 65 showed a profit of \$71, or nearly \$1.10 per hen."

Mr. W. D. Beebe of San Luis Obispo, wrote:

I am sure the State Polytechnic would not own up to having such poor hens as mentioned. The test was carried out on my own yards. The school happens to be about half a mile from me. "Render unto Caesar that which is Caesar's," etc.

We are told, however, that the school, or Dr. Twombly from the school, conducted the experiments, though the hens belong to Mr. Beebe. Whether Caesar gets his due or not it appears Beebe gets the eggs.

FOR CALIFORNIA.

The rivers and harbors of California is the theme of the September issue of the monthly magazine For California, published by the California Promotion Committee. The frontispiece of the present issue is a physical map of the State, showing the harbors and principal waterways.

It may be had for ten cents by addressing the Promotion Committee,

San Jose has a new method of hot air process for drying fruit which it is claimed will do away with any sulphuring, also with the field drying, and it is claimed to be even less expensive. The inventor now offers to cure prunes at \$3 per ton.

The Shorthorn

THORTHORNS are plainly favorites in California. At the last State Fair a magnificent showing was made which overshadowed that of any other breed.

The exhibit was largely of the beef strain, though there are many fine milk strain shorthorns in the State.

The Origin.

The shorthorn is native in the counties of York, Durham and Northumberland, England. The original stock from which it came is unknown, but supposed to be a cross between native English stock and introductions by the Norsemen and Romans.

The introduction to America was about 1783. In 1833 an importing society was formed in Ohio which introduced some magnificent animals and did much to make popular the shorthorn.

Milk Strain, or General Purpose.

Regarding the milk strain we quote from a paper prepared by John Lynch of Petaluma. Mr. Lynch has had years of experience with this breed and is qualified to speak of their merits.

Mr. Lynch says:—

For our purpose the best age to breed the young heifers is from eighteen to twenty-one months. If you breed them younger it will mar their growth and they may not breed the following season. And if breeding is delayed so that they do not produce a calf until they are three years old or over, they may become coarse and stagish. Usually breed the heifers from March to June 15th, and the cows from December 20th to June

15th. We do not like late calves and it is an old saying. "Never a June calf for a bull."

We prefer to use a young sire on heifers. There is less danger at calving time and a heifer's calf is as growthy as a cow's, though it may lack something in size on the start.

In the cow class, if the calf pleases us on arrival, the cow is bred back to the same sire. But if the calf is not

December. There were seven strippers, so-called. (Cows not bred by June 15th are not bred until the following December and when they will after that.) The remainder of the herd freshened during the spring months. There were 8 2-year-old heifers in the herd, fifty-five in all. A great deal of whole milk was fed to young calves the first half of March. The house use called for two gallons of milk and nearly two pounds of butter every day in the year. We shipped Sherry, Freitas & Co., San Francisco:

1454 pounds of butter in March.

A Shorthorn Sire in the Herd of John Lynch

all we expected, the cow is mated to some other sire.

The angular and leggy cows are bred to a smooth, sport-legged bull and vice versa.

A Uniform Herd.

Our idea was to have a uniform herd of uniform production. How well we succeeded in accomplishing what we set out to do will be seen from the following records which will stand inspection: Eight cows freshened in October, twelve in November, five in

1392 pounds of butter in April.
1622 pounds of butter in May

A Barometer.

I wish to call your attention to the dairy cow as a weather barometer. While there was an abundance of grass, much of the weather was cold, and a north wind blowing, so they dropped back quite a bit below the March yield. Conditions were quite favorable in May, so we have a gain of two hundred pounds. The yield of milk was not affected so much as

the butter fat. In April the daily yield of milk ranged about 1500 pounds, or 27 pounds per cow. Owing to the shortage of dairy help, the cows were driven in and corraled about 7½ to 8 hours a day or a higher average would certainly be made. This much shows the persistence of these cows as milkers, half the herd from far to seven months advanced in the milking period and bred as well. We feel that it is a good grass record on a mountain ranch, and while we do not feed for record making at any time through the fall and winter, feed sufficient to bring the cows in well and keep them at normal work. We feed them all the hay they can eat and to 6 pounds of grain, usually grown barley and bran, mixed half and half. The springers are put on a grain ration a few days before calving.

The Day You Buy.

There is a homely maxim for stockmen's guidance; it is this: "The day you buy is the day you sell. If you buy good ones, you certainly have good ones to sell. It has been our aim to buy our herd bulls from breeders who handled their cattle for dairy purposes. Since 1899 we have drawn from the Middle West and further Eastern herds for our new blood and have a number of herd bulls that run up to date and down to date.

In Orrick No. 183,989 we have a large, smooth animal of 2600 pounds who traces direct to the 46's. In City Buttercup 2nd, No. 222,133, we have a grandson of J. K. Innis, herd heifer Imp. Duke Buttercup. He is straight in Kitty Gray blood and without doubt the best specimen of a milking shorthorn sire in the West.—John Lynch, Petaluma.

The Dutch Belted Breed

IT HAS been the pleasure of the writer to see only one Dutch Belted herd in this State and that was at the recent State Fair. Quite a bunch of these peculiarly beautiful animals were there and attracted much attention. That herd was exhibited by Mr. U. G. Strader of Ceres.

A Bit of History.

The Dutch Belted is a native of Holland where they are known as Lakenfield cattle, the term Laken meaning blanket or short about body.

They originated back at least as far as the seventeenth Century. They were established by scientific breeding and a fad promoted by the nobility of the Netherlands.

They were introduced to America as early as 1838. Later, Barnum, the showman, became interested in them and did much to build up the breed.

Characteristics.

They are smaller than the Holsteins, perhaps midway between Jersey and Holstein in size. In fact, from a thousand to 1250 pounds is about the cow's weight. The color is always black with the white belt.

An Eastern breeder writing Mr. Strader regarding this breed says:

"I have been breeding them for eleven years. I use them for butter-making, and they are one of the best breed for buttermaking there is. They are not quite as rich in butter fat as the Jersey, but give a larger quantity of milk. They do not give quite as much milk as the Holstein, but richer in butter fat. I frequently test my cows for butter fat with the Babcock test, and I have never had one that tested less than four per cent running from that from 4.8 to 4.10 per cent.

"Three different men that I have had making butter for me claim that they can make more butter from my herd than from several Jersey or

Guernsey herds they have run for butter making.

"Again, they are very hardy and hearty, and will stand our New England winters with the changeable climate, and thrive on most any kind of fodder. Very docile and picturesque in the fields or pasture. I actually think they are the best breed for butter making in our country today."

Rare in this Country.

A little booklet regarding these animals in explanation of their scarcity, says:

They were originally imported into this country in small numbers on account of the fabulous prices demanded for them in Holland. There they were controlled by the Dutch nobility, and during the long wars the cattle were nearly exterminated by the opposing armies, and in later years it has been impossible to get fresh importations, so that the increase has been limited to America. Several fine herds have been exported to foreign countries and this has had its effect. Some of the wealthy breeders have destroyed the increase of their herds as they did not wish them to become common in their vicinity. The increase of this breed has also been materially retarded by the discarding of animals imperfect in color marking.

Ten Reasons.

A friend of the breed in giving ten points in their favor, says:

They are splendid dairy cows; are hardy and vigorous; are of the easy keeping sort; are of the rarest breed in the United States; are the most novel and attractive cattle in existence; represent the most perfect example of color breeding; are distinctly different from what your neighbor has; their milk is the ideal drinking milk, four per cent butter fat; are gentle in disposition, and always bring good prices when offered for sale.

Animal Industry Work at the University Farm

FOR MANY years animal industry work at the University has been seriously handicapped by the lack of proper equipment. Students have not had facilities for studying types of the different breeds of live stock. The University owns a small dairy herd which provides classroom material for the study of the breeds represented, but conditions at Berkeley do not allow of the maintenance of a beef herd, nor of the keeping of horses, sheep and swine. Material, therefore, in these classes could only be secured by having students visit some of the larger breeding establishments. While this is an excellent thing as a finishing process, it is not nearly so good for the beginner, as it is impossible to remain long enough at one place for him to secure a thorough appreciation of the difference in the quality of individual animals.

The purchase of the farm at Davis, known as the University Farm, tends to overcome many of these difficulties. It is the intention, in erecting barns and other buildings, to have them examples, both in construction and arrangements for the students and for the farmers who may visit the place.

The students, too, must be taught to plan farm buildings of convenient arrangements and economical construction so they may know how to plan them for their own use. When the buildings at the Farm are complete, the University will stock up with animals of all the leading breeds. The dairy herd will be increased and we shall secure representatives of the leading beef breeds, as well as specimens of those breeds of horses, sheep and swine that appear best suited to California conditions. With an equipment of this kind the students, both in the school and college, will have ample opportunity for studying breed characteristics. They will learn to recognize the bad as well as the good points and by constant study of the individuals the ideal type will be so firmly impressed on their minds that it will be impossible for them to forget it.

The work of selecting and judging, however, is not the only line of importance to the live stock man. He must know something of the early history of the different breeds and of their development so he may the more

The American Saddle Horse

IN THE early colonization period of America, many horses were imported from England and Holland. The newness of the country and the lack of good roads precluded the use of vehicles and necessitated riding rather than driving. By the time the pioneers moved westward to Kentucky, a fair "saddler" had been evolved.

A Bit of Kentucky History.

As the country became more settled the Kentuckians began to desire beauty and finish as well as strength and hardiness and, by luck or as an experiment, crossed their saddlers with the thoroughbreds, which were being used extensively in Virginia. In 1839 Imp. Hedgeford, a thoroughbred, was bred to Betsy Harrison, a native mare by Aratus, and Denmark was born.

Denmark was the originator of the American saddle horse. He was bred again to a "saddler" known as the Stevenson mare and they produced the great Gaines' Denmark. This horse, bred by careful selection, produced great stallions, and so prepotent were they that a family was founded as distinct in conformation, manners and gait as is the standard bred.

As the country became more developed and the roads improved, carriages were introduced, and so tractable was this horse that he was trained to draw a vehicle in addition to his other accomplishments. Thus he became a combination horse.

The stamina and courage of the breed has been proven, for during the Civil War, Morgan's command and other famous regiments were largely mounted upon the American saddle horse.

Recognized by Government.

Since the Spanish war, where they were also used and where they kept in good condition notwithstanding the rain and bad weather, Uncle Sam has recognized the efficiency of this breed by placing individuals of it at the head of the government cavalry studs in Porto Rico, the Philippines and other stations.

As evidence of his show-ring ability, we can point to the fact that one-third of the saddle champions at the Madison Square Garden in the last ten years are registered in the American saddle horse stud book, and fully three-quarters of the champions are eligible to registration.

The skeptic who has always thought that to ride a horse was to spoil him for driving can look at the authentic records of the achievements of this breed and be convinced of his error. Glorious Red Cloud, Thomas Lawson's unbeaten

champion, is a good example of what these animals can do in harness.

As to California.

Several years ago Mr. Spaulding (of athletic goods fame) started an American saddle horse farm at San Diego. He selected some of the best individuals in the south for his purpose. A year or so later John E. Marble bought from him Helen Rex, winner of the blue ribbon at the Los Angeles show of 1915. Experience with this animal convinced Mr. Marble of the possibilities of this breed, and in the fall of that year he purchased from General Castleman, of Louisville, Ky., president of the American Saddle Horse Association, five mares and a stallion, which he installed on his ranch at Ravenna.

Blue Ribbons.

Two of these mares had dropped filly colts before leaving Kentucky. On one of these colts, Pasadena, we first prize with her mother for mare and foal at the Lexington Horse Show, and is a full sister to Te Moor which was sold for \$7500 to head the stud of General Palmer in Colorado. The other filly, Selma, took first for two-year-old mare and championship mare at the California Fair this year, and is full sister to Lolita. The latter mare was sold to Mrs. Elliot at the Long Branch Horse Show for \$2500 as a three-year-old.

The five brood mares all have blue ribbons to their credit. Prince Arthur, the head of the stud, has won several ribbons before leaving Kentucky, took first prize in the continuation class at the Pasadena Horse Show in 1906, and at the State Fair this year took first for aged stallion and also the championship.

The colts produced in this stud show all the characteristics of the best type of the American saddle horse and those that have come from trotting mares, bred to Prince Arthur, are also distinctly the saddle horse type.

We can Beat the East.

The future seems bright for the breed in the southwest, as Californians are becoming enthused over the prospect of excelling the East with these horses as they have done in the past with the standard bred and the thoroughbred.

The American saddle horse is a perfect all around horse. He is courageous in time of danger, always a good friend and good for all. Rivaling the hackney in action in the ring and doing five gaits under the saddle, he still has the smooth, swinging stride of the roadster in harness.—Jean Carey, Los Angeles.

The Pacing Gait

Is the pace a natural gait? I say yes, every time. In the latter part of the sixteenth century, when we began importing horses from the mother country, they had nothing but pacers, so in the nature of things our first horses were pacers. Rhode Island developed the gait and on the strength of the gait shown by these horses they got up a big trade with Canada and the West Indies. The Dutch, who had a colony at New Amsterdam, now New York, brought the first horses into the United States that did not pace. They were from

Utrecht, in Germany. By uniting the Dutch horses of Utrecht with the native pacing mares of the country we got one of the most remarkable horses ever bred—Justin Morgan, bred from a Dutch horse at Wit Springfield, Mass. He did not show his mother's gait, but for short distances was fast at both the trot and the run. Taller and heavier than were the ordinary horses then in use, he distinguished himself for his ability to move loads that would anchor other horses.

A Bit of Early History.

In 1710, a jumper known as the

Prince Arthur

Darley Arabian was brought into England. With his advent began the disappearance of the pacing habit of action in English horses. In 1717 they brought from Paris, France, the Godolphin, a larger, heavier quartered horse than the Darley. The cross as a nick was ideal, and soon developed a class of jumping horses of which the English as a people became very proud. The county of Norfolk seems to have kept more to

was between the descendants of the Dutch horse and the pacing mare, and young Bashaw and a pacing mare, with more pacing blood added in nearly every cross from 1827 to 1844. Between that and 1850, Lady Moscow a Morgan, Pelham a converted pacer and Lady Suffolk a Messenger kept showing the possibility of a 2:30 trotter.

In 1844 Messenger blood produced a brown colt, unknown on his dam's

same blood, with the addition of the blood of Webber's Tom Thumb united with the Bashaw-Clay blood of Black Hawk 24 gave us a horse that on the extreme outskirts of civilization gave us two trotters sired when he was a four-year-old. Green's Bashaw was possibly the greatest trotting sire bred before the Civil war.

No Sore Toe.

In 1854 there was foaled a sorrel

old 2:25 trotter ever bred, produced Thistle, 2:13¼, pacing bred, to a daughter of Guy Wilkes produced Guy Thistle, 2:18¼ pacing. He bred to the daughter of a Shetland pony mare produced the trotter Lotta, 2:08¼. in 1907. Potten, by Patron, trotted to a record of 2:14¼, was put to pacing and paced in 2:12¼, and this season had out among his trotting colts Warner, 2:19¼. A gait that we have kept for 200 years and have developed in that time from 2:30 to 1:55 we are not prepared to accept as a sore toed or unbalanced trotter.—L. E. Clements, in Coleman's Rural.

A Typical American Saddle Horse
Selma, 3295, property of El Rancho Soledad, Ravenna, Cal.

the old manner of breeding, and here from one of these improved horses on a pacing mare came the Shales horse—the first horse to trot 100 miles in one day. All of this breeding was carried on without registration or written history, and is largely tintured with fiction, but in the early part of the eighteenth century an attempt was made to unite this traditional line of breeding, centering everything in a cross to one or both the Darley or the Godolphin, and in 1810 the first connected history of the running horses was given to the public.

The 2:30 Horse.

As late as 1750 we had imported less than fifty horses that carried the blood of the Darley or the Godolphin—Rhode Island was supplying the outside sections where travel was necessarily on horseback with these Naraganset pacers. At this time, or a little earlier, a horse probably three-fourths running bred, known as Messenger, was imported. He was larger than most of the horses then in America. The pacing habit of action seems to have been broken up in him, and his descendants became noted for long distance drives. As early as 1720, horses bred in Rhode Island and Virginia were pacing miles better than 2:30.

Another Century.

Another 100 years and one of the pacing mares of the country was bred to a little black horse called Grand Bashaw, and got Young Bashaw that was bred from a mare brought from Ohio—then on the borderland of civilization, and in 1827 she foaled a black colt that became noted as a trotter, and in the formation of our present trotting breed, and was registered as Andrew Jackson 4. From 1827 to 1844 the fight for supremacy

side, that has shown in his descendants less inclination to revert to the pace than any horse or line of breeding yet produced. In 1849 a union of Messenger and pacing blood with the blood of the Norfolk trotter, Belle-founder gave us Hambletonian. The

pacing colt that was the first horse to sire 50 2:30 trotters. This was Blue Bull 75. Sidney was a trotter, but for some cause went to pacing and took a record pacing of 2:19¼. Bred to a pacing bred mare the dam of the first two-year-

California Importer of Clydesdales

Along the banks of the River Clyde, back in old Scotland, there were many sturdy Scots breeding up a strain of horses of which it is said: "They surpass all others in length of stride, in straightness and sprightliness of movement, in their ability to keep their hocks together, with mechanical accuracy of motion, whether walking or trotting."

This horse was the Clydesdale, of which thousands have been imported to America, and many of them are today raising the grade of the American draft horse.

Amongst those who have engaged in the importing is Mr. Wm. McKie of 407 Aliso street, Los Angeles, himself "imported," coming direct from the farm in old Scotland, where his father for years bred the Clyde.

For the past fifteen years Mr. McKie has been engaged in importing Clydes, also Hackneys and Percherons. But his pride and favorite is the Scotch horse.

The one whose photograph appears on this page is Mirror, (13106,) (12643,) which was imported and is owned by Mr. McKie. This magnificent animal is five years old, weighs over 1800 pounds and is almost perfect in form.

He was first prize winner of California State Fair, '07, also at Pasadena '07 horse show.

At the State Fair grounds this horse attracted much attention for his open, intelligent countenance, fine form and carriage.

Any one interested in these horses should get in touch with Mr. William McKie, 407 Aliso street, Los Angeles

Every Horse Owner Needs This Book Sent Free, If You Write For It

Everything about horses, their care, breeding, feeding, and treatment of their diseases, is in Pratts New Horse Book, the most complete and valuable ever published. It is the work of the most expert Veterinarians, prepared especially for us at great expense, and intended to sell at 25 cents a copy.

But we are willing to send you a copy entirely free of charge, if you are a horse owner, and are willing to profit by the knowledge it offers you. Simply send us a postal card, with your name and address, saying you want Pratts New Horse Book, and a copy will be sent you promptly postpaid.

This book is not a mere advertisement—but a large 72-page book which tells everything any horse owner needs to know to successfully breed and raise horses and cure their various ailments. You'll surely get many valuable hints out of it. Send for a copy today. Also remember that nothing will more quickly and surely build up a run-down horse than

Pratts Animal Regulator

It improves their digestion, regulates their bowels, tones up the system, and puts new life and spirit in the animal. It is the greatest disease preventive known. Thousands of horse owners testify to its value. Try it for your horses, cows or sheep and see how quickly beneficial results will follow. Get it at your dealer's.

EXPERT ADVICE FREE

When any disease affects your stock, remember you can consult our expert Veterinarians without cost. Simply write, stating the symptoms, and reliable advice will be sent you free.

DOUBLE GUARANTEE

You run no risk when you buy a Pratt Preparation—you get a guarantee of its value by us and by your dealer that it will do everything claimed for it. What more could you ask?

Your dealer has a Pratt remedy for every animal ailment, including Pratts Liniment, Colic Cure, Worm Powder, and Spavin Remedy. Ask him about them.

Grind Corn and Cob Profits

This "Jack-of-All-Trades" Engine and Grinder grinds corn and cob at one operation, so you don't have to shell the corn and grind the cobs afterward. Saves its price in feed alone. The engine runs, churn, separator, pump, buzz saw—does almost all of the hard-work chores. It also earns money by being used for neighbors. "Jack-of-All-Trades" is the ideal farm engine because portable, easiest to understand and run—most economical in use of fuel. Built of very best materials to stand hard knocks. Our name on every engine is your best guarantee. Comes to you complete, so you can set it to work at once.

Does This:
Runs Buzz Saw,
Pump, Grinder,
Churn, Separ-
ator, and does
other chores.

California Angoras

ANGORA goats were brought to California about forty years ago, and for some time after their introduction into this State, there was considerable experimenting done by breeding the Angora bucks to the common goats of California.

The first cross was covered with a short, silky coat of mohair, which, to beginners, looked like a very profitable material. However, when the animals were shorn, it was discovered that the weight of the fleece on this first cross was not more than one pound per head, and when this cross-bred hair was shipped to the mills, they immediately objected to the fleece on account of the number of common goat hairs in the material and the scarcity and shortness of mohair fibers. Very little was

stock, we may mention that C. Bailey & Sons Co., of San Jose, Cal., one of the pioneers of Angora industry, won the Premier Championships for exhibitors and breeders at the last World's Fair at St. Louis. These were the highest honors obtainable and were secured in competition with all of the best American flocks and some South African stock.

California has, undoubtedly, an immense acreage which is especially adapted to Angora goat raising. Goats are natural browsers and the brush-clad hills of the Sierras and Coast Range are especially suitable for Angora farming. Angora goats require much the same care and attention that sheep do. They cannot be turned loose upon the ranges and expected to net a revenue without careful handling.

Capetown

A Great Sire Imported from South Africa by C. P. Bailey & Sons

known about Angora goats at that time and beginners were easily persuaded that these first cross animals were real Angoras.

A good many of the early Angora goat farmers in California paid dearly for their experience in the Angora business, as they bought these low-bred goats for Angoras at comparatively high prices and they were never able to make a reasonable interest on their investment. Some of the original breeders of Angora goats have continued in the business and they have today flocks of Angoras bred from the best of Turkish and South African sires and dams.

As an evidence of the quality of

Any eighteen-inch woven wire fence, topped by two or three barbed wires will hold goats. They do not jump over fences unless they are trained to, but they do go through or under them.

Goats do well in almost any climate, but the California foothills are especially suitable, because the brush does not lose its strength in the winter time. Goats can be run on the range the year round, and except on a few bad days, will make good living for themselves without extra feeding. There are now many thousand good Angora goats in California, and the industry is growing rapidly in this State.

Milch Goats

WHILE milch goats have long been a prominent feature of live stock industry in Europe, no special attention has been given the subject in this country until 1904, when sixteen Toggenburg and ten Saanen goats were imported from Switzerland.

The Toggenburg goat is larger than our native goat, brown in color with a white bar down each side of the face, and usually hornless. They are especially noted for their milking qualities, giving from four to five quarts a day, as a rule, and continuing in profit for seven or eight months. As with cows, good food and regular milking are necessary to obtain best results. They seem to adapt themselves readily to California conditions. They must have a

good shelter from storms always accessible, and in this climate they also seek shade during the heat of the day. A rocky hillside is their delight, and low, wet pasture land should never be used. Especial precautions should be taken against their browsing on pasture where they have been running for any length of time, as the poisoned grass causes a disease of the bowels almost incurable. The goat is practically immune from tuberculosis.

Pegler, an English authority on the milch goat, says:

"Apart from its medicinal qualities goat's milk is, for domestic purposes alone, far superior to the ordinary milk supplied by dairymen, has all who have tried it can testify. Boiled and used with coffee it is delicious.

giving the latter a rich, creamy appearance, while a few drops in a cup of tea are more than equivalent to a teaspoonful of cow's milk. When used in cakes and puddings its superiority is quickly apparent both to the sight and taste, imparting a rich yellow color to these articles when cooked, and thereby, acting economically by lessening the requisite number of eggs. Its only disadvantage for any purpose is its liability to curdle, which it is very apt to do if used rather old. It bears diluting well and even when mixed in the proportion of half and half is by no means 'sky blue.' Many persons are impressed with the idea that this milk has a peculiar flavor, but this impression is entirely erroneous, for when drawn clean from an animal in health it resembles cow's milk both in taste and appearance, the only difference being that it is richer, thicker and slightly sweeter, containing as it does, a larger proportion of sugar and cream and less water."—H. A. Wood, Pasadena.

A Coming Favorite

IN RESPONSE to your request for information concerning the milch goat, I might say that since preparing the paper on that subject for the Farmers' Club Institute about three years ago, which you published in the Cultivator at that time, I have improved every opportunity for studying the milch goat question; have written and received a great many letters on the subject and have cared for and milked one myself for a period of six months; have given the milk a fair trial as a baby food and for general household use and I can assure you that I am now more of an enthusiast than ever for this clean, economical little dairy animal.

Hard to Get.

The main reason they have not come into more general use is the expense and difficulty in securing good milch goats. In addition to the quarantine regulations against their native countries, the great risk and heavy expense of their long journey is almost prohibitive. Although our Department of Agriculture at Washington has spent considerable money in gathering and distributing information, and in other ways trying to encourage the milch-goat industry. The custom officials still exact a duty of 20 per cent ad valorem when they arrive at the port of entry. In California.

I placed an order for several head with Mr. F. S. Peer for his 1905 importation, but when they arrived, without giving us a chance, he turned them over to another party who at once raised the price agreed upon.

One year ago I secured in Canada, for parties here, a choice young doe of each of the three leading Swiss breeds, Toggenburg, Saanen and Alpine, and with them a pure bred Nubian buck intending to try the Nubian cross on these different breeds. Unfortunately the Nubian was unsound when he arrived and died shortly afterwards.

The young does have all dropped their first kids this season and they and their kids are thriving and doing well and give evidence that any one of these breeds may be readily acclimated and will thrive and do well here. And I believe the Nubian would have done equally as well had

JUICY STEAKS

To repair waste tissue in an animal organism requires food. To make growth necessitates the giving of a greater portion, and to build fat on tissue—the end sought in putting a steer, hog, or sheep in market condition—calls for a very large consumption of nutritious elements. Now heavy feeding has a tendency to bring about derangement of the digestive organs. The wise feeder prepares the animal system against the steady and tiring strain which the stuffing process puts on both stomach and nerves.

He follows the suggestion of Dr. Hess (M. D., D. V. S.), who has formulated a prescription in which are found the elements long ago recognized as beneficial in building up and strengthening the digestion.

DR HESS STOCK FOOD

not only makes the ration digest perfectly, but it creates increased appetite for more. A steer fed with Dr. Hess Stock Food consumes, besides its grain, a larger amount of rough fodder, which of course makes the grain more available for fat forming, thus adding to the profit of feeding.

Dr. Hess Stock Food contains also iron for the blood and nitrates to act as cleansers of the system, which are endorsed by such men as Professors Quitman, Winslow and Finley Dun. It makes cows give more milk and keeps farm teams in fine condition.

Sold on a Written Guarantee.

100 lbs. \$7.00 25 lb. pail \$2.00.

Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal compound, and this paper is back of the guarantee.

FREE from the 1st to the 10th of each month—Dr. Hess (M. D., D. V. S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book any time for the asking. Mention this paper.

CAN MONEY BE MADE IN STOCK.

We have heard people say, "California isn't a stock country." We were inclined to accept this statement before becoming acquainted in the State, but after a few years, residence and considerable traveling, we have altered that opinion. California may not have been a good stock country under former conditions of stock management, but under improved conditions of irrigation, and knowledge obtained from experience, it is a settled fact that this state is a reliable stock country.

Before the Imperial valley had become settled and watered, that whole section was a desert. Today it is an oasis, and among its wondrous resources, the stock industry is credited about the first. Cattle, horses and hogs from the greater per centage of the wealth of this land of plenty, and the stock industry in the Imperial valley is but in its infancy.

In the territory north of the Tehachapi, which was formerly divided into large holdings, of thousands of acres, estates of old Californians, stock always abounded. Immense fortunes were made by sheep and cattle men, but the size of the holdings precluded a general stock business.

At the present time there are not nearly so many great estates. The land has been divided into farms of reasonable size, and there are hundreds of farmers raising stock now, where there was one twenty years ago. In proportion to the growth of this industry the wealth of Northern and Central California has increased until it is conceded that in the near future the stock in-

dustry of that section will equalize that of some of the Middle West States. Statistics compiled by the Department of Agriculture for 1906 show that there were 1,167,107 milch cows in the State valued at \$21,474,767. Horses, 391,680, valued at \$36,120,721. Mules, 80,750, valued at \$8,599,875. Sheep, 2,422,423, valued at \$8,006,107. Swine, 550,581, valued at \$3,909,125. In swine there is a shortage which ought not to exist when we remember that there is a greater percentage of profit in hogs than in any other class of stock raised.

But as irrigation and alfalfa increases the swine industry will develop, so will the dairy, for as our farmers gain experience, especially those who come from eastern states, they will find that more money is realized from swine than from beef cattle and proportionately more from dairy cows. The next twenty-five years will develop the stock industry in California, until it will reach respectable comparison to the best stock raising States in the Middle West.

IMPURE ALFALFA SEED.

The risks run in buying alfalfa seed are far more general than is generally supposed. F. D. Coburn, of Kansas, in an address before the Shawnee County Alfalfa Club, made the startling statement that as high as 88 per cent of noxious seeds had been found in one sack of alfalfa seed.

Recognizing the fact that much of the seed on sale is entirely unreliable, the Agricultural Department at Washington, and some of the more wide awake experiment stations, have been making tests to discover the defects and values of seed ordinarily found in the market, and some startling revelations are the result. The Washington investigators, for example, found in one pound of so-called alfalfa seed, on sale, 32,420 noxious weed seeds; in another, 23,082, and in still another, 21,848. Of the first named pound less than 59 per cent was alfalfa; less than 29 per cent was germinable, and among its impurities were 5490 seeds of dodder—surely the devil's own invention. One pound of another lot contained only a fraction over five per cent that would grow, and a third lot but slightly over six per cent.

The Ohio Station bought for testing fifteen different samples, a dollar's worth each. A pound from one of these carried 18,144 lambs quarter or pigweed seeds, and another 6,420 seeds of crab grass and 3,325 of foxtail. Seed supposedly costing \$7.80 per bushel was, when cleaned, found to have cost actually \$12.74 per bushel.

The Oklahoma Station, among many samples, tested one having 60 per cent pure seed and 40 per cent of impurities. Only 65 per cent was germinable. Another sample which at first sight would be classed as good, was found to contain per pound 453 witch grass seeds, 90 plantain seeds, 151 crab grass seeds, 90 wild carrot seeds, 453 foxtail seeds and 155 Russian thistle seeds. As the official who made this test says, if twenty pounds of alfalfa seed of this grade were used to sow an acre one would have approximately two seeds of witch grass and two foxtail seeds for every ten square feet; four seeds of plantain, seven Russian thistle and six seeds of crab grass for each hundred square feet. These would doubtless grow and the mischief they might lead to nobody can estimate.

The same per cent of impure seeds prevails in many lots of alfalfa seed shipped into California, and every other state, and it is a matter of the gravest concern to growers to know when they are obtaining pure seed. There seems to be but one course, as Mr. Coburn suggests, and that is to buy seed of only thoroughly reliable dealers or growers whose names are a guarantee and stand for reliability. Get samples early and test them. Learn positively that it is alfalfa seed, and not something else, and that it will grow. If more than 10 per cent of impure seed shows up, don't buy it, for something is wrong. Choice seed, the only kind worth sowing, always commands a good price, and it is worth it. The Agricultural Department at Washington, or your state experiment station, will test samples of seeds sent, and report on them without charge.

Remember this, and save waste and weed pest and consequent loss.

Shop Talk

SPECIAL OFFER—To the many readers of the Cultivator who are not subscribers, and to others to whom this special stock number of our paper will go, we make this offer of the Cultivator free for the balance of the year.

Many of our subscribers know of some one who has been wanting the Cultivator, but for various reasons have put off ordering, and now is a good time to remind them and to act.

Just fill out the following blank, enclose \$1 (the regular yearly price,) and we will send the Cultivator from date of receipt to January 1, 1909. Act quick for you see the sooner done, the better for you.

Cultivator Pub. Co. 190
115 1/2 N. Broadway,
Los Angeles, Cal.

Gentlemen: Enclosed find \$., for which please send the Cultivator from receipt of this order to January 1, 1909. Name,

Whenever you feel in the humor to do the Cultivator a favor, just write in to us giving the names of anyone you may know who is, or should be, interested in our paper. We will send them sample copies and get acquainted.

Such as the above, and suggestions, are appreciated by us, though we can not always acknowledge them by letter.

THE LESSON OF THE HOUR.

The present financial flurry shall serve to bring the country back to a common sense view of living, it will have performed a valuable service for which the nation ought to be grateful.

For the past twenty-five years we have been living too fast; spending money recklessly without a thought of future possibilities. We now see our mistake. We must return to a more economical way of living. We must dress less extravagantly and buy fewer autos. In short, we must economize. The effort so to do will be attended with inconvenience, but it must be made. Men and women will have to learn that they can not go on spending money lavishly as heretofore, they must count the cost before making the investment. All this will do us good. We shall emerge from the present crisis wiser, and, we trust, financially sounder, than for years. The country is all right and our banks will be right in a little time, for the wealth of the country is in our farms and our farmers, and when this is the case, no lasting peril will befall the nation.

GREATER APPROPRIATION NEEDED.

The last year book of the United States Department of Agriculture gives some interesting statistics relative to State appropriations for farmers' institutes. According to this authority farmers' institutes were held last year in all the States and Territories, with the exception of Alaska, Florida, Nevada, New Mexico and Washington.

The published summary of the work shows that Illinois appropriated for the work \$30,281.55 and that 108 institutes were held. The second largest appropriation made was by Pennsylvania of \$20,500, which held 226 institutes.

Nebraska spent \$8607 for 160 institutes, Iowa \$8096 on 69 institutes, Minnesota \$22,238 on 105 institutes, Colorado \$400 on 40 institutes, Kansas held 150 institutes. California spent \$6000 on 84 institutes.

California's sessions numbered 296 and the total attendance at these meetings was 20,470. The vast service rendered the farmers by the institutes held in California contains enough argument for a more liberal appropriation, without any appeal from the Cultivator along this line, but we make the assertion that no appropriation can be made which is more far-reaching in its value than that made for farmers' institute work, and it ought to be doubled.

Agricultural Notes of the Pacific Coast

Northern California

Alfalfa land is in great demand at Dixon.

A new cheese factory is to be established at Modesto.

Several lots of hops have been sold at Ukiah at 83-4 cents.

Orange and olive crops at Oroville are about the same as last year.

At a recent wool sale in Cloverdale the price ranged from 13 to 121-2 cents.

Practically all the Tokays about Woodland were forwarded before the recent rain.

The Coldbrook Creamery Company at Loleta, Humboldt county, has closed up.

Santa Rosa soft shells grafted on the California black walnut are proving profitable at Ukiah.

The Yolo Democrat is giving some strong articles on the profitability of fruit culture in this section.

P. H. O'Gara of the Department of Agriculture is in Sacramento to continue pear blight investigations.

The Farmers' Institute at Davisville was a complete success both as to attendance and interest shown.

The money stringency has caused some fruit buyers in northern Sacramento to withdraw from that field.

Senator Flint is in Washington looking after the interests of California in the National Drainage Convention.

The shipments of fruit from Placerville have not been very extensive this year, but have been exceedingly profitable.

The forest service of the U. S. Department of Agriculture has established an inspection office at San Francisco.

The Chico Driving Association has made arrangements for the purchasing of land on which to maintain a track.

Dixon creamery paid its patrons \$5000 during October, allowing four and three-fifths cents above the market for butter fat.

The president has signed a proclamation creating additions aggregating 490,451 acres to the Stanislaus and Lassen National parks.

The Central Creamery Company at Eureka is to enlarge its storage department by the addition of a forty-ton refrigerating machine.

Chestnuts and walnuts, in an experimental planting at Ukiah, have proved so satisfactory that they will be planted on a larger scale.

Investigation reveals the fact that the White Fly is in existence at Wilhows, and was first found in the grove surrounding the courthouse.

A train of six cars of granges of Sacramento county attended the dedication of the State farm at Davisville at the recent Farmers' Institute.

A committee has been appointed looking toward the establishment of a school of experimental horticulture with Luther Burbank at its head.

David Lubin, formerly of Sacramento, is now in Washington conferring with the President regarding the International Institute of Agriculture.

Central California

Modesto is working for a new cannery.

The San Jose Poultry Show is being held this week.

The precipitation of Monterey county amounted to 1.16.

The storm gave San Jose little over one inch of rainfall.

The seed farm industry in San Benito county is increasing.

Guggenheim Company at Fresno is paying 43-4 cents for raisins.

The forming of a farmers' club at Kerman, is under discussion.

Carpenter & Co.'s cheese factory in Tulare county is to be enlarged.

Some raisin growers at Fresno are planning to seed their own raisins.

The precipitation at Bakersfield amounted to nearly one-half inch.

The Turlock Journal reports olives as very profitable in that section.

Pajaro valley is still in straits over the shortage of cars to move its apple crop.

The Bayside Canning Company at Alviso is putting up fifteen cases of tomatoes a day.

The San Jose Grange has adopted resolutions recommending the initiative and referendum.

Miller & Lux are to throw open twenty-five acres of land for colonization near Madera.

The Tulare county Mutual Fire Insurance Association has written insurance amounting to \$165,000.

The county veterinarian of Santa Clara county, declares that anthrax is entirely eradicated in that county.

The grape crop at Wrights and other Santa Cruz mountain grape-growing sections, is a partial failure owing to the early rains.

At the recent meeting of the Tulare grange, John Tuohy gave an account of the State grange at San Jose.

W. W. Mackie, of the Division Soils, is to experiment in the restoring of wornout potato soils near Stockton.

The citrus growers near Lindsay have pooled the shipping of their oranges, and will ship through the Citrus Union.

Dr. H. S. Reed, of the Department at Washington, is soon to make a line of experiments near Stockton to learn as to crops to rotate with potatoes.

The failure of the grape crop about Wrights is very serious, as the entire shipment this year amounted to only four cars against seventy-five last year.

Orange picking in Tulare county section is causing the question of Japanese labor to be discussed, and it is hoped the growers will realize the danger and give white labor preference if possible.

Some embarrassment exists in Fresno owing to the lack of funds to handle the great raisin output of this year. The price is still good, the financial stringency only making the securing of money on the bills of lading almost impossible.

The recent rains have made the ground so that every plow in the country will soon be busy making ready for the coming grain crop.

Southern California

West Riverside is soon to have a creamery.

A pre-cooling plant is to be erected at Coachella.

San Bernardino is to have a new large pre-cooling plant.

Orange county has about three thousand acres of alfalfa.

A meeting of cantaloupe growers was held at Imperial on the 29th.

Chino's average yield of beets was twelve tons per acre of 16.1 per cent beets.

The Brawley Mutual Water Company has been organized with a capital stock of \$20,000.

A farmer in Imperial valley is harvesting his second crop of corn from the same ground this year.

Reforestation San Clemente under direction of the Department of Agriculture is contemplated.

The walnut crop is practically all in hand and found to be materially short of last year's output.

Redlands Fruit Association will increase the capacity of its packing house before packing season.

Forest Supervisor Charlton, is building a house at Glendora for use of forest rangers in forest reserve.

Colorado melon growers are visiting Imperial valley to learn regarding its conditions in melon culture.

The sugar factory for which Santa Ana has been laboring for some time will not be constructed during the coming year.

The campaign of the Chino sugar factory ended on Sunday Oct 20, after 56 days continuous run. Forty thousand tons of beets were sliced.

A sheep breeder has introduced a trainload or three thousand two hundred sheep from the northern part of the State. They will be used for breeding purposes.

The Durate-Monrovia Fruit Exchange forwarded 177,359 boxes of oranges or about four hundred and sixty-two cars. The amount paid to growers was \$264,126. Fifteen thousand was spent for labor in the packing house.

The crop of olives at Hemet is unusually large and the olives are of very fine grade. The Big Springs ranch is showing some olives of extraordinary size, some of them being and inch and an half long and three inches in circumference.

TOMATO GROWERS' IMPORTANT MEETING.

A tomato growers' meeting will be held at the new Pathological Laboratory, Whittier, on Wednesday, November 20th, at 10 a. m.

The object of this meeting will be to show the growers the possibility and methods of controlling the tomato blight, which has recently destroyed the crop in this section. Treatment by spraying of vines on the laboratory grounds has resulted in controlling the blight completely at a very slight expense.

All persons interested in tomatoes are urged to attend and see the results of this treatment. A practical demonstration of the methods of preparing and applying the spray will be given.

Laboratory grounds at corner of Greenleaf avenue and Baldwin street, one block south of Pacific Electric terminus.—Ralph E. Smith, Supt.

The Coast

Oregon pears are selling at New York at ten cents each.

Fifty cars of apples at North Yakima are waiting cars.

Barley is proving a most profitable crop at Moscow, Idaho.

Walnuts have become a staple crop in Yamhill county, Oregon.

Alfalfa at Kenwich, Wash., averages twelve tons per acre.

Weiser, Wash., is shipping large quantities of cattle to Alaska.

Record prices are being obtained in Montana for wool this season.

A fruit growers' union has recently been formed at Eugene, Oregon.

Utah college people are planning for a series of institutes to be begun soon.

Forest Grove, Oregon, recently shipped a full carload of angora goats.

The hired men of Oregon have become so independent that they refuse to milk cows.

A Tacoma, Wash., gardener marketed \$705 worth of celery from one acre of ground.

A fruit grower at Caldwell, Idaho, grew a thousand dollars worth of apples on five acres.

Yamhill county, Oregon, held an apple show in M'Minnville, October 31 to November 2.

The large cannery recently built at Sumner, Washington, has a total floor space of 51,300 feet.

For want of storage eighteen thousand sacks of wheat are piled on the ground at Mohler, Wash.

At a sale of six thousand head of sheep at North Yakima last week the average price was \$4.75 per head.

Experimental planting of olives in Calumbia county, Washington, are said to have been very successful.

With grain stacked everywhere at Pendleton, Oregon, the farmers are still clamoring for better car service.

The government has hired eleven hunters to wage war on wolves, wild cats and mountain lions on national forest lands of Oregon.

Prunes paid Oregon growers this year \$1,590,625; pears, peaches and cherries all in excess of \$230,000, and strawberries over \$400,000.

The sheepmen of Oregon are refusing to pasture their sheep on the national forest reserves, claiming they can do better with private pasture.

According to the president of the State Board of Horticulture, the success with which Oregon growers are meeting will "within a short time make fruit growing the greatest source of wealth in the State."

What is believed to be the largest check ever paid to any one wheat grower in the Northwest, has just been received by a Pendleton farmer for the season's crop raised on about 3000 acres of Umatilla wheat land. The check was drawn by the Pacific Elevator Company for \$70,842.70.

On the basis of reports from county inspectors, the value of Oregon's fruit crop this year is officially estimated at \$4,275,135. This figure, far in excess of any previous year, is based on amounts actually received by growers, and represents an increase of 53 per cent. over the fruit crop valuation of last year.

Mayer "Special Merit" School Shoes are expressly made for the hard knocks and severe wear of healthy, romping school children.

They are made of thoroughly seasoned upper leather and tough, old-process and time-seasoned soles, the strongest and most durable material obtainable—that's why they "wear like iron."

Plenty of room for growing feet, sensibly shaped shoes, strong enough for the hardest everyday use, dressy enough for Sundays.

Your dealer will supply you; if not, write to us. Look for the name and trade-mark on the sole.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

In Next Issue.

A large number of queries are crowded out of this issue on account of the large amount of space given to live stock in this special number.

Corned Beef.

Will you kindly tell me how to make corned beef?—W. H. Murray.

To one hundred pounds beef, take eight pounds salt, five of sugar or five pints molasses (Orleans best, but any good will do), two ounces soda, one ounce saltpeter, four gallons soft water, or enough to cover the meat. Mix part of the salt and sugar together, rub each piece and place it in the barrel (oak is best), having covered the bottom with salt. When the meat is all in, put the remainder of salt and sugar in the water. Dissolve the soda and saltpeter in hot water, add it to the brine and pour over the meat; place a board on top of meat, with a weight sufficient to keep it under the brine. Let the pieces intended for dried beef remain in the brine for three weeks, take out, place in a tub, cover with water, let stand over night, string and dry. String it (smoke for a few days, if you like), hang it up to ceiling over the kitchen stove, or on a frame set behind the stove, turn round once a day so as to give all parts an equal exposure, and let remain for three or four weeks. Test by cutting a piece, which should be well dried on the outside, and free from rawness to the center. When dried, sprinkle with ground black pepper, put in paper sacks, tie up tightly, and hang in a cool, dry, dark place, or put, without sacks, in an empty flour barrel and cover closely. Boil brine, skim well, let cool, and pour over the bony pieces left. These are good boiled and eaten either hot or cold, and they will keep good several months. Tongue may be pickled with the beef.

Or if a spiced beef is wanted, here is another:

To ten pounds beef, take two cups salt, two cups molasses, two tablespoons saltpeter, one tablespoon ground pepper, one tablespoon cloves; rub well into the beef, turn every day, and rub the mixture in; will be ready for use in ten days.

Thrush.

I have a horse that has something the matter with his feet. On all feet, just above the hoofs, for about one inch, there is a hard, honeycomb substance, white in color, coming off at times, leaving it raw. Have had it one year. It was affected when I got it, but not so bad as now.—A Subscriber.

This is a case of neglected thrush. Rub a little of the following lotion into diseased parts and repeat in two days:

Carbolic acid, 3 ounces.

Raw linseed oil, 3 ounces.

Comp Tinc benzoin, 2 ounces.

Shake before using and apply with a small swab.—Dr. Oliver.

Founder.

I have a mule which is lame in both front legs; walks fairly well in a moderate walk, but faster than a common walk. Travels with much difficulty. Legs or feet slightly in advance of natural walking position or motion. No swelling. Will you

kindly inform me of treatment.—Parlier Subscriber.

Your mule has been foundered, and if of long standing will remain stiff. Blister around the coronet, and a few months' run on wet pasture will be a benefit.—Dr. A. W. J. Oliver.

Bursting Cabbage.

Is there any way to handle cabbage that heads up in December to prevent it from bursting. Have a very fine crop coming on of the Winningstadt variety and they promise well if can carry them through. F. G. FLINT, Kelseyville, Lake Co.

I know of no practical method to prevent the bursting of the heads when operations are on a large scale. It has often been suggested that to partially pull up or twist off the the stock, it will result in so checking the growth as to hold it over for a limited period. I have never practiced it, but have often had the trouble feared by your correspondent. If there is opportunity to dispose of such part of the crop as ripens up first it would be one way of solving the trouble. If the suggestion of partially pulling is tried, you want to be careful not to sever all the roots, as the object would be to simply check the growth, and yet allow enough roots to remain to keep the plant in fair condition. The success of the experiment would depend somewhat upon weather conditions. More likely to succeed if the weather should remain cool. Q. A. L.

More About Onions.

Kindly inform me through your valuable paper as to what varieties of onions and potatoes are best for market use. Also method of growing them in deep subsoil. Is it advisable to plant them in young peach orchard? L. S. A., Fresno.

It would be easier to reply to such queries if the correspondents would state how or where they wish to market their product. If wanted for the local market some early varieties as well as late ones should be grown. If it is expected to wholesale only then it is usually better to confine one's efforts to growing a crop of some one standard variety that is well known and popular. Extra Early Red and Earliest White Queen are two varieties of onions largely grown in California for local markets—the former variety being more popular north of Tehachepi than here. Yellow Globe, Danvers and Australian Brown are grown largely for main crop. The Australian Brown is very popular with the dealer because of its splendid keeping qualities, but it wants good rich sandy loam and careful culture to produce well.

Early Rose and Burbank are varieties of potatoes largely grown in all sections of the State. A variety known as White Rose produces enormous crops of handsome potatoes and while not of the highest quality, always sells well because of its fine looks.

Plant the onion seed about February 1st in rows that are 14 to 16 inches apart. Thin out so that the onions will stand about three inches apart in the row. The ground must be kept in good condition by thorough cultivation, and damp enough by irrigation to avoid any check in the

Telephone and Electric Equipment Company
Seattle San Francisco Los Angeles

growth of the plants from want of water. Unless you have land moist enough to grow any garden crop without irrigation, do not attempt to grow onions without making provision for irrigation.

Grow the potatoes in rows 21-2 or 3 feet apart. I prefer medium-sized well-formed potatoes for seed and usually cut them so that there will be one or two good eyes to each piece and plant about 12 inches apart in the furrow. Cover about 4 inches deep. In ordinary seasons, if the cultivation has been thorough, one or two irrigations will be sufficient—especially if they have been planted as early as February 1.

There is no objection to growing either of these crops between rows of young peach trees, provided you do not plant too close. How close will depend upon their size. But in every case room enough must be left to get by the trees with the cultivator. If these crops are grown with good care and kept clean, it will be an advantage to the peach trees.—Q. A. L.

SACRAMENTO COUNTY BERKSHIRES.

Sunnyside, Stock Farm, owned by G. A. Murphy, is located at Perkins, six miles east of Sacramento in the fertile American River valley.

The conditions are favorable for production of good hogs. Fruit, melons, squash and an abundance of green peas and alfalfa furnish a variety of foods.

But one breed of hogs is kept on the ranch. The large Berkshire being the favored one. They are noted for their size. A 10,949 weighed 1100 pounds at the State Fair, being the largest hog on the Pacific Coast.

There are sows in the herd that could be made to weigh eight hundred. Among the sows is Curzon of

Sunnyside, who won first prize as a yearling in 1906 and since then has farrowed 34 pigs, three litters in 360 days. One of her first pigs won first prize with a litter at the last fair; another first under six months. Perkins Farm Beauty has won more blue ribbons than any sow on the Coast. She is six years of age and won blue ribbons every year until this, when her daughter, Fashion Prin-

cess was placed ahead of her. Ruby Duchess is a very large, smooth sow 18 months of age, weighing about 500 pounds in breeding condition. She was an easy winner in her class and her progeny won second and third under six months; those of Curzon of Sunnyside taking first.

Several other sows complete the herd, one being a great granddaughter of Perkins Farm Beauty. Columbia fourth, the sensational show sow of 1907, was bred by H. C. and H. B. Harpending of Dundee, N. Y.; farrowed Nov. 20 1906 and sired by Starlight Royal by Gen. Starlight. She was an easy winner in a strong class of eleven and took championship honors. She has since been

sold to Judge Carrol Cook of San Francisco for two hundred dollars, the highest price ever paid for a Berkshire in California. She will be a money maker, as the pigs she will produce from Baron Premier 31st, by Premier Duke, will pay for the dam. Her litter sister will take her place in Sunnyside herd.

The boars in the herd, at present, are Prince of Perkins by Pacific Duke. This boar, while not a beauty, had girth of 78 inches and has the largest bone one could expect in a hog. He sired many winners since being in my herd. H. Gentry of Sedalia, Mo., and shipped to Sunnyside when a pig. His first litter from a young sow took the blue ribbon and he has one litter of fourteen to his credit.

Messrs. Harpending are getting a choice shipment ready for Sunnyside consisting of four males and two females. The choice male will be kept in the herd and the others re-shipped to Honolulu after they have rested from their trip.

Sunnyside Farm can supply breeders with young stock in Berkshires or Shorthorns at the very lowest prices. All letters of enquiry answered cheerfully and punctually.

On this page is a reproduction of a photo of one of Mr. Murphy's Berkshires, also another on cover of this number.

When writing advertisers, mention Cultivator

The Hereford

NO CLASS of beef cattle has become more popular in this country in the past twenty years than the Hereford. The Hereford is strictly a beef breed.

It is a native of England, taking its name from the town of Hereford where it first sprang into prominence, just what crosses originated this breed is difficult of analysis, for it dates back well into the eighteenth Century.

To America.

The introduction of the Hereford

The "rustling" proclivities which make it so valuable to breeders and rangers and the general perfectness of its type. The rapidity with which this breed fattens, under favorable conditions, and the ease with which it "finishes" for market, are important elements which have given it such wide distinction.

In size, it is one of the largest breeds. The bulls often weigh 2200 pounds and the cows 1300 or over. For more than 20 years the meat of the Hereford has brought the highest price in the English market and

Earl of Shadeland 22d, 27147
Champion Hereford of 1888

into America first occurred, so far as the records show, in 1817 when Henry Clay bought a herd and transported it to his Kentucky home.

Since that period the growth of the breed has been steady, although not marked, until twenty years when it has grown with such remarkable strides as to cause it to be imparted into every State in the Union where beef strains

its early maturity has made its "baby beef" famous all over the world.

At the great International stock show held at St. Louis, it took highest premiums for weight, and at the Chicago show the highest price was for a Hereford bull.

Distribution.

The geographical distribution of

are grown. It may be safely said that this breed has been brought to a higher state of improvement than any other beef breed in America, unless it be the Galloway.

Characteristics.

The characteristics which gave prominence to the Hereford were its remarkable strength of bone, which rendered it possible to distribute an enormous amount of fat on the body without injury to the animal. Its ability to live and thrive in a rigid climate where other breeds failed.

the Hereford is very extensive. From Herefordshire in Great Britain, it extends through Scotland, Ireland and Wales. In the province of Canada it has become the leading beef breed and in the cattle-producing sections of the South Atlantic States, as well as the Pacific States, it is extensively bred. The grazing qualities of the class render it most popular in level countries, and in latitudes where vicissitudes of climate exist it has greatest success.

Concluded on Page 480

The Galloway

THE Galloway is one of the newer introductions to California and as yet little known by most breeders.

It is a native of Southwestern Scotland, near the sea, and takes its name from the province or ancient Kingdom of Galloway. Its origin is obscure. Originally the breed in

Many Admirers.

I will give you a brief outline on what the Galloway cattle have done and are doing today.

At the leading shows and fairs of the country the Galloway has as many admirers as any other breed. The Galloway steer stood second to none in 1892 International. The

Galloway Bull, Charlie Strawbridge, 23816

By Imp. Scottish Standard, cost \$3,000. Dam, Juliette 2nd of Brookside. Property of G. W. Edwards, Goleta

that section—that is, in the middle of the eighteenth century—were horned. The polled strain were, apparently, bred up and later the horns disappeared.

The development of the modern Galloway was not fully taken up until about 1877. Just when the first introduction to America was made is unknown. Possibly about 1830-37.

Galloway won junior championship in 1900 in carload at the International at Chicago and sold in car lots at Kansas city at the Royal Cattle Show held there 1901, at \$1.40 higher per hundred than any other breed. The Galloways have won three of the Grand Champion prizes out of six offered at Chicago and Kansas city in 1900-1902-1903, as many as all other breeds combined.

In '53 they were first imported into Canada.

The first Galloway herdbook appeared in Scotland in 1878. The first breeders' association in this country was not formed till '82. There are now 27,000 registrations in this country.

John Troup, manager of the Geo. L. Edward's stock farm at Goleta, has furnished Cultivator readers the following as to the merits of this breed:

At the International carcass contest they won first and fourth. The former dressed out 68.88 per cent. The fourth prize dressed 68.08 per cent.

At the live stock exhibit at El Paso, Texas, in 1903, the Galloway heifer, Semiramis Jackson, was awarded grand champion over all other breeds.

Eighty head of foreign-bred Galloways recently selected from leading British herds, is now meeting with

Tuttle's Elixir

The Horse Remedy of the Age

*No stable is now well equipped without this incomparable liniment on the shelf. It has cured more blemishes and made more horses clean limbed than any other remedy in the world. It never fails to locate lameness.

\$100 Reward

Our offer is always open. Some cases have passed the curable stage. But whenever a cure is possible we will pay \$100 for any failure of Tuttle's Elixir to cure Spavin, Curb, Splint, Sprain, Colic or Lameness.

It is the main dependence of Veterinaries, Express, Livery and Transfer Stables as a

Leg and Body Wash

Beware of all blisters; they give only temporary relief, if any.

Tuttle's Hoof Ointment, Worm Powders, Condition Powders, White Star Liniment and Family Elixir are other excellent specifics. "Veterinary Experience," an infallible guide for horsemen, is free. Every disease and symptom made plain. Write for copy. Postage 2c.

Confidence

is essential to business prosperity.

Confidence is simply another name for credit, and when credit is lacking business is paralyzed.

Ripples on the surface of prosperity do not alarm us. We have confidence in Los Angeles and we have confidence in her banks, born of intimate association with them for many years.

Because of this confidence we are still selling conservative mortgages and high grade bonds and are taking our pay in checks on the Los Angeles banks.

If you have money to invest, do not delay calling on us because your money is tied up temporarily in the Savings Banks.

We can use your checks and wait for our money until the banks resume payment. We invest our own money in the securities offered. They are safe. We invite investigation.

With the Citrus Growers

"DUTY OF WATER" IN IRRIGATION.

THE phrase "duty of water" has originated in the irrigation countries. By it is meant the amount of water (to be supplied by irrigation) required to mature a given crop.

This, of course, varies greatly with the humidity and temperature of the air and the temperature of the soil during the growing season, the character and conditions of the soil, the depth of water table below the surface, the contour of the land to be irrigated, the crop grown, the experience and knowledge of the irrigator, etc.

In a dry, hot climate the evaporation from the surface of the soil and transpiration from the leaves of the plants is great, consequently more water must be applied to make up for this loss. Here the tiller plays an important part in preventing to a certain extent the evaporation from the surface.

In a sandy soil the water will percolate down to the water table and pass off much more rapidly than in a clayey soil, hence more water is required than on a clayey soil to get the same growth.

When the water table is near the surface, sufficient moisture may be brought up by capillary to do away with irrigation, but when it is deep down much water is lost by percolation down to it that would otherwise be available for plant growth, writes Carlos Stannard, in Western World.

On a farm where the slopes are comparatively great, much more water is required to produce a given yield than on a more level land, as the water seeps into the subsoil and especially more rapidly.

Often this water, appearing further down the slope, makes irrigation unnecessary at the latter place. Even drainage is sometimes necessary.

The duty of water varies much with the crop and the length of the season. Thus the duty in acres per second foot (450 gallons per minute) for ninety days for alfalfa is, on an average, 102 acres; for potatoes, 488 acres; for barley, 138 acres; for oats, 126 acres; for wheat, 142 acres. Or the depth of water supplied by irrigation—alfalfa, 1.97 feet; potatoes, .56 feet; barley, 1.53 feet; oats, 1.73 feet; wheat, 1.62 feet.

The experience of the irrigator has much to do with the amount of water applied. One man will often apply a third or half more, or even twice as much water as another on the same crop and the same piece of land.

If the plot to be irrigated is at a distance from the main canal, there is more or less water, depending on the soil traversed, lost by seepage. In certain soils this becomes an important factor in the duty of water.

The understanding of the various phases of this subject means much more to the farmer who must irrigate than is generally supposed. It means all the difference between success and a meager living or failure in an irrigated section.

Mr. L. M. Wilcox, in his book on Irrigation Farming, says: "In Colorado water rights vested on a basis of the low duty assigned to water ten years ago have in instances deteriorated lands and reduced their productivity by a surfeit in application; while on adjoining lands, through an enforced economy, a higher duty, better conditions of the soil and greater productivity have resulted."

Green Manuring

Now is the time to plant crops for green manuring. The best crops for this purpose are Vetch, Canadian Field Peas and Fenugreek. For information and prices of the seed write to

The Poland-China Hog

IT MAY be of interest to many breeders of Poland-China hogs to call their attention to the fact that the breed of swine known as Poland-Chinas is about seventy years old. It has not been known by that name that long. The name Poland-China was adopted by the National Swine Breeders' Convention, November 1872, and for thirty-five years this particular breed has been known by that name. This popular hog was bred for thirty-five years previous by a farmer in Malmi valley, Ohio.

It is well known to Poland-China breeders that there were many crosses in the first make-up of the present improved Poland-China hog, such as Byfield, Poland and Irish Grayhairs. They were of large size and coarse. The fancies and preferences of the late breeders dictated that the color as well as the shape and style should be improved.

Hence the careful breeders have produced an animal that is popular because of its symmetry and beauty; its easy feeding qualities, docility, its ability to return such enormous profits for the care and feed it consumes.

Careful mating has brought them out to be so perfect in shape and color, that many, very many, of them have brought prices at public sales as high as \$8000 each.

In looking up the public sales to take place, twenty-one in November, and the number of hogs averaging

fifty in each sale, the average price will not be less than \$75 each.

The price of pork hogs last week in Chicago was 6.25 and 6.50 with upward tendency.

California cannot half supply the demand, and why not? There is plenty of land that has ceased to be profitable for raising grain, that can be used for hog raising, and also enrich the land at the same time.

Number one hogs in California are now worth eight cents gross and a scarcity at that.

I have been raising recorded Poland-China hogs for twenty-five years, and they always paid good profits for care and feed. Get the best and start your herd; there is money in them. Attention and feed is what is required. Commence right by purchasing registered stock and good individuals, and feed right and you will make money.—P. H. Murphy, Perkins, Sacramento Co.

EIGHTH ANNUAL CONVENTION C. C. O. A.

The California Creamery Operators Association will meet in annual session this year at the university farm at Davisville, Nov. 22 and 23.

There will be five sessions and an exhibit of butter and cheese, for which prizes will be offered.

Davisville seems to be rapidly getting a reputation as a "convention center," at least as to farmers' meetings.

When writing advertisers, mention Cultivator.

Deciduous Fruit Culture

THE FOREIGN RAISIN CROP.

THE time has arrived when it is possible to give the condition and quantity of the foreign raisin and currant crop of the season.

The Spanish raisin crop is now secured and, like the California crop, has suffered no damage from rain. It is estimated at upwards of 67,000,000 pounds, which is a large crop. The crop is well cured and satisfactory in every way, excepting that the berries are rather small and choice fruit will, therefore, probably fetch good prices. Prices have opened very reasonably in London at about \$7 a hundred-weight (112 pounds,) in 28-pound boxes, duty paid, but a decline in price is expected, as lower prices are being quoted for October shipments. A fair quantity of Valencias had arrived in London by the middle of September.

The Greek currant crop is variously estimated from 138,000 to 150,000 long tons (2240 pounds,) but it will probably turn out about 140,000 tons. In recent years it has been:

	Tons.
1904.....	151,000
1905.....	160,500
1906.....	135,500

The market in Greece has opened very strong and is advancing. The quality generally speaking, is poor and below the average of last year, and shows unmistakable signs of rain damage.

The Smyrna-Sultana crop has suffered very severely from rain, and most of the fruit is discolored. The crop estimates have been reduced from about 50,000 long tons (2240 pounds) to 35,000 tons, and there has been a considerable advance in price in consequence. The market is in an unsettled state, and it is impossible to predict the future, as so far only small supplies have been shipped. The quantity of Sultanas imported into this country is not as large as is generally supposed. The totals during the last five years being:

Year.	Pounds.
1902.....	2,030,374
1903.....	3,055,398
1904.....	3,850,444
1905.....	1,685,275
1906.....	7,372,568

During the same period the currants imported have amounted to:

1902.....	36,238,976
1903.....	33,878,209
1904.....	28,247,649
1905.....	31,742,919
1906.....	37,078,311

—Geo. Robertson, in Fresno Republica.

HOW THE LACE-WINGED FLY FEEDS.

Mr. E. P. Taylor, field entomologist for the Western Slope Fruit Investigations, in Colorado, has reported the unusual abundance of the "Chrysopa," or Lace-winged fly, in the vicinity of Grand Junction the past summer, and its great service to the fruit growers in destroying the woolly aphid. It requires a large number of lice to supply a Chrysopa larva for one day, as it lives upon the blood of the lice only. Like some blood-eating animals of a higher order, these Chrysopa larvae are very active and quick in their movements. One who is not acquainted with the habits of this fly might think it strange that an insect with jaws could suck the blood of its victims, but such is the case with this strange insect. The

jaws are long, curved and very sharp and meet in front of the head. On the under side of the jaw is a groove into which fits a mouth-piece known to the entomologist as a maxilla. It is grooved along the upper surface and the two grooves so fit as to make a tube through which the body fluids of the lice are drawn into the mouth of our little friend, the Chrysopa. It is interesting to watch them feed. A plant louse or soft bodied insect, will be seized by the long mandibles, held up at "arms length," sucked dry in a moment or two and then the shriveled body is cast aside and another victim is seized and given a similar treatment. In this way a large number of plant lice are killed by one Chrysopa larva in a day. So it is really true that these insects possessed of jaws or mandibles derive all their food by suction and eat no solids. Because of their fondness for the blood of plant lice, the lace-winged flies are commonly known as Aphis Lions.—C. P. Gillette, Entomologist, State Agricultural College, Fort Collins, Colorado.

APPLE SCAB.

There is no fruit disease more familiar to the fruit grower than apple scab, sometimes called black spot. This disease is the result of a fungous growth which makes scabby spots on the fruit and also attacks the leaves and newly-grown shoots.

Sometimes the infection spreads very rapidly, beginning early in the spring. It dwarfs the young leaves, many times killing the foliage, causing the fruit to shrivel and in some instances the entire crop is ruined. Besides this, the disease works serious loss by dwarfing the apples that do mature. One statistician estimates that the loss in Missouri alone from this one disease is nearly \$500,000 per year.

It has been found that three applications of Bordeaux-arsenical mixture give the best results. The first application should be made just after the blossoms fall, the arsenical poison being used to destroy the codling moth. The second should be made about two weeks later, and a third about two weeks after the second. Some advise the first application to be just before the leaf buds open, and the experience of a number of fruit growers in the Ozark regions shows that this is the better practice.

DAVIS—DAVISVILLE.

The name of the town where the University Farm is located is to be changed. At present the postoffice is Davisville, and the railroad station is called Davis, but a movement is now on foot to change the name of the postoffice to that of Davis. The movement is headed by the university people who suffer great inconvenience because of the difference in name between the station and postoffice, and the likeness of Davisville to Danville. The townspeople are also petitioning the Postmaster-General for a change of the name of postoffice, and an early answer is expected.

THE FLOWER SHOW.

THE Southern California gave its regular autumn flower show last week. The attendance was not up to that of last year, though a most creditable exhibit was made.

Of course Queen Chrysanthemum ruled, though her sway was disputed by a magnificent line of carnations; also a showing of many new roses. The chrysanthemum show was hardly up to that made by Billy Marugg of Pomona, who made the most extensive display of fine bloom ever made in Los Angeles.

This society has given these shows, two each year, for several years and with only fair encouragement on the part of the flower-loving public. The exhibit should have drawn a greater attendance.

Although the tuberose is one of the most beautiful and fragrant flowers to be found anywhere, comparatively few are grown on our Western farms. Why this is so is hard to explain, for tuberose will flourish in any ordinary garden soil and require no more care than other varieties. The bulbs are cheap and are easily planted.

The new German butterfly bean deserves a place at every home. The beans are light brown and white, spotted and mottled; are produced in large pods and if taken off before fully ripe are a delicious vegetable. The plants begin to bloom early and blossom abundantly. The flowers appear in large clusters and surpass in beauty the old scarlet runner. It is a vine to please the eye as well as the palate.—Field and Farm.

The Guernsey

THE native home of the Guernsey is the Guernsey Island off the coast of France in the English Channel.

The entire population of the island aggregates only about 35,000 and the acreage of the island is only about 12,600 acres. Yet this breed has spread to nearly all parts of the world. It has been in America since 1824, and is today a great factor in the dairy industry.

The origin of the Guernsey, like that of the Jersey, is obscure. The purity of the breed is maintained by enactment of laws excluding any other breed for its island home.

California has secured some remarkable animals of this breed. Some three or four years ago this paper had a report of the year's performance of Maltie, 9184, then the property of W. M. March. That cow gave a yield of 11,681 pounds of milk of 5.07 per cent fat, or a total of 591.96 pounds of fat. That crowds up well towards 700 pounds of butter a year. That remarkable cow is now the property of El Rancho Saledad at Ravenna, as is Waller, 9561, another cow admitted the advanced registry. These with their offspring and others, are the foundation for a great herd, which the Messrs. Marble are raising up.

Another great herd on this Coast is that of the W. S. Ladel estate at Portland, Oregon. Three of that herd are in the advanced registry and more are being tested.

This little wealth producer will become better known in this State and become a greater favorite.

A friend of the breed says of it: May I call attention to the great progress that has been made by the Guernsey cow during the last few years? There are now 35,000 Guern-

ASPARAGUS OR LACE FERN.

This is the name often given to Asparagus plumosus. When the plants seem inclined to make one long vine rather than a bushy growth, nip out the center when the shoots attain the height of a foot or eighteen inches. Sprouts will then appear from the roots or nodes of the stem. If a plant fails to grow satisfactorily shift it into a larger pot, and add porous, fibrous loam for the new roots to penetrate. The great beauty of this exquisite foliage plant warrants all the care that can be bestowed upon it. It is really one of the most charming of foliage house plants, and should be one of the first chosen. It has no enemies; its culture is simple, and its propagation is readily effected by seeds, which come up with certainty after they have been in the ground for from three to four weeks.

The new double nasturtiums, scarlet with maroon markings and yellow with crimson markings, are popular wherever they are known. The flowers are double to the center, are of large size, of more substance than the single flowers and consequently more lasting. The vines are vigorous, bear handsome foliage and bloom freely and continuously. They do not bear seeds and the whole energy of the plant is used in the production of foliage and flowers. They are of the easiest culture and grow and bloom satisfactorily either in summer or winter. They do quite as well bedded in summer as the single varieties. They are grown only from cuttings.

sey registered and fully one-half of these have been placed in the Register during the last ten years. The breed stands in the front rank as producers of the highest grade of dairy products. In the Pan-American test the highest score for the ten breeds competing was awarded the Guernsey on natural color and flavor, as was also the highest aggregate score.

The American Guernsey Cattle Club was the first to establish an Advanced Register on a yearly basis. During the few years this has been established the records of 549 cows and young heifers have been followed. The average of these is a good index of the capability of the breed. These records show an average year's yield of 8000 pounds of milk, 407 pounds and 5.08 per cent butter fat.

During this time the highest records made have been 17,297 pounds of milk and 857 pounds of butter fat. The latter is equivalent to 1000 pounds of butter. The highest yearly records, made in connection with an Advanced Register of any breed in the world, are now held by the Guernseys.

To the private estate the Guernsey is pre-eminently suited. She is beautiful in appearance among velvety green lawns and pastures, and she is able to impart to her products in the midst of winter the high natural golden color and soft flavor of the June pasture. Though the demand for Guernseys has been great, they have not fallen into the hands of the speculative breeders. They are known and appreciated on more and more dairy farms, and the prospect for the future is bright.

ASPARAGUS FROM THE SEED.

IN ANSWER to a correspondent, Professor W. P. Massey gives a practical advice in the Country Gentleman on growing asparagus from the seed.

To produce green shoots of asparagus that are cut at the surface of the ground after the shoots have attained the proper length, the roots must be nearer the surface than where the white shoots are desired. It has long been the practice to plant an asparagus plantation with one or two-year-old roots grown in a nursery. But I have long ago demonstrated in my own experience that this is a needless expense, and that good asparagus can be grown a year or two earlier by sowing the seed right where the plantation is to be, and never to disturb them by transplanting.

Asparagus demands very highly enriched soil, and no good crops can be grown without the most lavish manuring and fertilization. The best soil for the crop is a sandy loam underlain with clay. In the method I now wish to describe, furrows are made deeply four feet apart and six to eight inches deep. These furrows are to be filled with a compost of manure and woods earth that has been piled and turned for a month or two, making the compost two-thirds woods earth or black mold and one-third manure, preferably clear cow manure. Fill the furrows within three inches of the surface, and then with a garden seed

drill sow the seed in the furrows. Make this sowing early in the spring. As the seeds germinate, work the soil gradually to the plants till perfectly level, and as soon as the plants are well established thin out to about two feet in the row. The young plants thus thinned out can be at once transplanted as easily as cabbage plants to other rows prepared as the first and at the same distance apart.

Cultivate during the summer thoroughly, and during the early summer growth scatter alongside the rows about 150 pounds of nitrate of soda per acre. In the fall give the plantation a dressing of kainit at the rate of 500 pounds per acre. The salt in the kainit will tend to keep down weeds, and will have a tendency to dissolve plant food in the soil through the winter, and the potash will materially aid the growth the following spring.

Treated in this way I have cut fairly good asparagus the spring after sowing the seed. But little cutting should then be done, and the plantation should in early spring have a dressing of not less than 1000 pounds per acre broadcast of the following mixture: Acid phosphate, 900 pounds; fish scrap or cottonseed meal, 600 pounds; nitrate of soda, 100 pounds; muriate of potash, 400 pounds. A ton of fertilizer made in this way will be a good standard, high-grade fertilizer for almost any vegetable crop. The plants grown in this way will have their roots near the surface, and will feel the first warmth of the spring sun, and will be earlier than the plants grown in the old way for white-stalked asparagus.

To grow white-stemmed asparagus, prepare furrows as directed for the above method, only make them fully a foot deep. Place in the bottom a good layer of the prepared compost.

On this set either one-year-old roots or the young plants thinned from the spring sowing. As they start to grow, work the soil gradually to the rows in the cultivation till the land is level, always keeping the plant tops well above the soil. Give these also a good dressing of nitrate of soda during their early growth to encourage a rapid growth. In the late summer and fall, work furrows to the rows so that the plants will stand on elevated beds with the roots well down in the soil. In early spring or late winter apply the fertilizer advised before, and give clean cultivation through the summer. The fertilization in either method must be an annual thing, and the application of kainit liberal in the fall.

The second spring cutting may begin in a moderate way. The rows should be well banked up as soon as the tips of the shoots appear. The stalks are cut by pulling the earth from them and cutting well down with a knife made for the purpose. If the stalks are cut before the tips turn green at all, the white stalks will be comparatively tender; but if the stalks shoot above the ground and get green, the part that is white underground will be tough and stringy. These white stalks make a pretty appearance in the bunches, but market buyers are more and more disposed to buy the more tender and green stalks.

GARDENING NEAR TREES.

Gardening in an arid or even a semi-arid region is a problem that the man from Missouri and kindred countries have to be shown. In the first place, nine out of ten who have a small home garden water too often and not enough at a time. Then the home garden plot is nearly always underlaid with roots from nearby trees. Where this is the case, it is all but impossible to accomplish satisfactory results, except in the case of deciduous trees, where such vegetables as lettuce, turnips, beets, cabbages and other similar hardy vegetables will do nicely if put in the fall.

Lettuce will reseed itself and appear year after year with little or no trouble to the rancher, leaving a few of the choicest head to go to seed and let the winds scatter it about is all that is necessary. They will appear after the first rains in the fall. But as the home garden is always rather small the loss of moisture by capillary attraction in a lateral direction is rather large and great care must be taken to keep the outer edges wet for successful summer gardening.

It is absolutely necessary that tree roots should not interfere. It is useless to plant closer than twenty feet to trees six years old and as old trees often have roots seventy-five to a hundred feet in a lateral direction, we need not look far for the cause of the garden not doing nicely. Of course, where there is damp land which is fertile enough, trees interfere with summer gardening only by making too much shade.—J. C. Ostergard.

"I think," said the prison visitor, "it would be helpful to you if you would take some good motto and try to live up to it."

"Yes," said the convict. "Now, I'd like to select, for instance, 'We are here today and gone tomorrow.'" —Philadelphia Press.

Other roofs leak. You need Gen-as-co Ready Roofing.

You know that tin lasts only till it rusts; shingles are good only till they warp, rot, or catch fire; coal-tar and other residual pitch roofings protect only till they dry-out and crack.

The only real lasting waterproofer is natural asphalt. We use Trinidad Lake Asphalt—the standard asphalt of the world—for Gen-as-co Ready Roofing. And Gen-as-co makes a roof that will not leak. Don't take a substitute.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

GETTING READY FOR THE SHOW.

NOVEMBER practically opens the show campaign. Many of our readers will no doubt show this season for the first time. Therefore we feel that an article on care and conditioning birds for the show will be appreciated.

At most of the shows, competition is so keen that to win, one's birds must be in perfect condition. This can only be done by careful selection, condition and feeding.

Selecting show birds.

Before we attempt to select our show birds, we should have a good knowledge of the Standard and know just what we want to cull out. Then we should go over our birds and throw out all that are disqualified. Don't put a bird in the show that is disqualified and then blame the judge for throwing it out of the class. Next put out all undersized birds, or birds that do not weigh within one to two pounds of the standard weight for two pounds is about as much as can be put on a bird in three or four weeks. This will leave you birds whose imperfections will only be cut by the judge.

Cooping and Training.

Cooping and training the birds is a very necessary part of the preparation, for a bird that is wild and frightened will stand in awkward and ungainly positions, and stands no chance with a bird that has been handled and trained.

It is not necessary to keep them cooped all the time, in fact you can get them in better condition by cooping half the time and letting them have their freedom the other half in nice, clean, shady runs. Put them in the coop at night and handle them a little while in the morning, then feed them a little meat or bread or something that they like, in this way it is easy to get them used to being handled.

Keep plenty of nice, clean straw in the coops, throw whole grain in this and let them scratch for it, this will give them exercise and at the same time will polish their legs and make them look bright and clean.

Dust them well with a good lice powder and get them free from vermin. In making up pens for exhibitions, pick birds that match as nearly as possible, getting them all of one size, with combs about the same. Don't select one with a small comb and then one with a large one as such things always mar the appearance and make the weak points more noticeable.

We will not give directions for washing as we published an excellent article on this in the issue of October 17.

POULTRY ON FRUIT FARMS.

California orchardists are awakening to the importance of combined fruit and poultry culture. In addition to the valuable service rendered in ridding the orchard of insects the fowls are a never-failing source of revenue. Poultry distributed throughout an orchard on the colony plan thrive well and yield a large income in proportion to the expense. The busy hen offers a product which always commands "ready cash."

AROUND THE YARDS.

Breed only from the best.

"Doubtful" eggs should be kept at home.

Poultry properly handled is a source of profit.

Neatness counts wonderfully in making sales.

A long continued single diet will induce indigestion.

Constipation is caused by too much concentrated food.

The yolk of the egg spoils much quicker than the white.

The object in caponizing is to secure both quality and size.

Too much buckwheat has a tendency to produce costiveness.

"Pure food" eggs are not made by access to manure piles.

An eastern duck raiser used large quantities of green onions, cut up acorns, wild plums, cherries, grapes and elderberries. To these he added grit, a little tincture of iron in drinking water, and all the minnows and shiners he could secure. His ducks were equal to the Maryland canvassbacks, which feed on wild celery, etc., and his stock was in great demand for the dinners of exclusive clubs.

When fowls have a "bad cold" at once the cry is "roup;" should they have distemper, it is called roup; should diphtheria present it, it is termed roup, and so on. In short, should there be exhibited external symptoms of internal inflammation or any ailment of throat, mouth or nostrils, it is charged up to roup. Nevertheless, it is rarely the case that a fowl is any good after a spell of sickness, no matter what that sickness may be. Preventives should receive more attention than they do. Comfort, sound food, and disinfection, are the mainstay of the poultry business in a sanitary sense.—Up-to-Date Farmer.

METHOD OF FEEDING.

Fowls should be fed from troughs and not have the mash thrown on the ground. There are several varieties of troughs which are good. They should be so made that they can be easily filled and cleaned and at the same time do not allow the hens to get their feet inside.

WATER.

There are several styles of water founts, and the most objectionable are those which are so constructed that it is not possible to see the inside, and as a result they are often allowed to become filthy.

One of the best materials that a poultryman can use for supplying the required lime for the egg shells is oyster shell or any other variety of shell. One pound of oyster shell contain sufficient lime for the shells of about seven dozen eggs. Shells are not the only source of lime necessary for egg shells. Bones also contain a large percentage of lime

Your Poultry Profit

can be kept up right through the winter if you feed your hens right and keep them warm. Our book, "Making Poultry Pay," tells how to feed them. The way to keep them warm is to roof and side your poultry houses with

REX FLINTKOTE ROOFING

It is absolutely water-proof and wind-tight. It is non-conducting and keeps a poultry house warmer in winter and cooler in summer. It will resist fire. It is easy to put on. It will last for years—cheaper in the long run than the cheapest you can buy. Be sure you "Look for the Boy."

HOW TO GET WINTER EGGS.

Those who want winter eggs and have not already commenced to feed with that end in view will have to hustle.

In the first place, if your yearling hens have not moulted, shut them up in a small, clean pen, about 100x15 feet for fifty hens, and feed them about one quart of oats once a day, with plenty of fresh water and sharp grit for ten days or two weeks. By that time they will be poor and thin. Then let them out and feed them a good strong ration composed of 32 parts corn meal, 30 parts meat meal, 30 parts ground clover or alfalfa, this to be constantly on hand in a feed hopper; then in addition feed in deep litter 200 lb. cracked corn, 360 lb. wheat, and 130 lb. oats.

Early in the morning the grain is fed at the rate of a quart to 25 fowls; about eleven the same amount may be fed again to induce exercise. The hopper is always kept filled and a smaller one is kept supplied with grit, charcoal and oyster shells. Keep the houses clean and the floor deep with litter and the birds will soon be singing about with red combs.

For those who do not like the dry feed method an excellent mash can be made in the following way: In the morning chop a barn pail full of clover, cut in quarter-inch length, and over this pour boiling water until the clover is covered; then cover

More Eggs—More Money

The increased production of eggs from a very small flock of poultry will soon pay for an Enterprise Bone, Shell and Corn Mill. Cracked corn, ground bone, oyster and other shells, etc., are important items of egg-making material and must be furnished in winter to secure an abundance of high-priced eggs. They can be furnished at lowest cost by the use of an

No. 750
Price, \$8.50

ENTERPRISE

Bone, Shell and Corn Mill

Order one early in the season, and the hens will surely pay for it. The mill shown in cut costs only \$8.50. Will grind corn, dry bones, oyster and other shells, etc., making valuable poultry food. May be used for making bone meal fertilizer.

A good all-round mill for farmers and poultrymen, and for strength and durability is unexcelled. Weight 60 lbs. Capacity, 1½ bushels of corn per hour. Look for the name "Enterprise" on the machine you buy. Sold by Hardware and General Stores, etc.

THE ENTERPRISE MFG. CO. OF PA.,
240 Dauphin St.,
Philadelphia, Pa.

50 Cent Eggs

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

Mrs. C. D. Hubbard, Box 282, San Fernando, Cal.

with an old bag and allow it to steam until time to feed for supper. Now mix 100 lb. of bran, 100 lb. corn meal, 100 lb. wheat middlings, 100 lb. linseed meal and 100 lb. meat meal. Of course this may be mixed in smaller quantities, but in the same proportion. About three o'clock put into tin buckets about four quarts each of the meal mixture, then stir in enough clover to make a nice crumbly mash in each bucket. This will be about enough for a hundred hens, but do not feed more than they will clean up in 10 minutes. Some prefer to feed the mash at noon; that is a question that each poultry man can settle best for himself. The question of the number of times a day fowls should be fed can only be settled by experimenting. With the dry feed method the fowls are given a little grain, as I have said, early in the morning and about eleven. Green food is supplied in the shape of mangels or clover. A good many successful men feed three times, while others, who are quite as successful, feed only twice.—Country Gentleman.

ANIMAL INDUSTRY WORK AT THE UNIVERSITY FARM.

Continued from Page 463

intelligently continue and improve on the work that has been begun. One man may be given the best animals, may have a good farm and good buildings and yet, in a few years his stock will deteriorate very much and become unprofitable. Another may have much poorer animals and buildings and yet be making a profit. The difference lies in the lack of knowledge—knowledge of the care and management and of feeding of live stock. Experiment stations have shown how the common cow, in the hands of the farmer, producing about 140 pounds of milk per day may be taken and, by proper attention to the feeding and handling, be made to produce as high as 250 pounds per year. These subjects, therefore, will be given great attention and the student will be taught how to feed so as to provide the nutrients animals require for each line of work.

The work with horses is exceedingly important. Despite the opinion frequently expressed that this is an automobile age and soon there will be no use for the horse, we find there is today, a greater demand and higher prices secured for good individuals. This is true, not only in California where it might be said that conditions

are such as to cause an unusual demand for work horses, but it is true also of all of the great horse markets in the middle west and in the east. There is no doubt that buyers today are more discriminating than they were. This means that the breeder must study the demands of the market and provide a better animal than heretofore.

Students in animal industry will be given constant practice in judging horses; determining their age, their condition as regards soundness and their value in the different market classes. They will be taught how to select a stallion of the right type, to know that he is of the right conformation and free from blemishes. Naturally the most attention will be given to draft horses. This is necessary because the amount of money available for our use will not allow of our securing an equipment of all the breeds.

Work of instruction, however, is not the only use to which the University Farm will be put. Investigations is an important part of the work of the college and there are a large number of problems that must be studied as soon as the buildings and equipment are provided. California conditions, soil and climate, differ so much from conditions that prevail in other States that we have a number of problems that are peculiarly our own.

The live stock men of this State have taken such a great interest in securing the farm, it is most appropriate that the University should decide that the first buildings erected should be for the work in animal industry. A creamery building and live stock pavilion are now ready for use. It is only necessary, therefore for the live stock people of the State to show their continued interest in the farm and work by availing themselves of the opportunities these will afford.—E. W. Major, professor of animal industry, University of California.

THE HEREFORD.

Continued from Page 472

It does best in cold countries, although in medium sections it thrives. From Bakersfield north through California, except in the very interior counties, where hot weather obtains for an extended period, it would do well, while in Oregon and Washington growers would find the Hereford ideal cattle.

For Large Ranges.

We could not recommend the breed to small farmers, for wide range is necessary to its greatest success, although in the Eastern States and especially in Maine, Herefords have long been very popular. Oxen of this breed are used today on the hills of New England and are preferable to horses, because of their blocky build and extreme strength.

The writer has been breeding "Whitefaces" for a number of years in Iowa, and although his farm is small, has found the industry pleasant and lucrative. Ready sale is found for all pure blood males, and cows have brought high prices. We do not draw any invidious comparisons between the Hereford and other breeds, but experience teaches us that no breed of beef cattle has excelled it in the local and foreign markets.—J. J. S.

Your Poultry Require

LILLY'S BEST POULTRY TONIC

Strengthens the digestive organs, tones up the system, stimulates growth, purifies the blood and greatly increases the production of eggs.

After trial of your Poultry Tonic my egg yield doubled in number, and am so well pleased that I have ordered my grocer to keep it on hand always for me. I deem it indispensable. GEO. A COMING FAVORITE.

Continued from Page 467

he been healthy when he was shipped.

A Toggenburg.

About the middle of last December I purchased in Denver and kept for my own use, a fine mature Toggenburg doe. Six weeks later she dropped two fine large kids which I at once separated from the mother and raised on the bottle using regular infant nipples. I had no trouble in getting them started on bottle and after the first week or two I gave them mostly separated cow's milk, feeding them three times a day. They developed very rapidly. This doe also seemed to adapt herself readily to the new climate and conditions and started off with four quarts of milk per day, her weight being only 96 pounds. She proved herself a very regular and uniform milker. Her present owner writes that she was still giving full three quarts per day seven months after kidding.

This goat was kept on chain on vacant lot adjoining my place during the day and under shelter at night during the winter and spring; was fed crushed barley and oat and alfalfa hay in addition to what little grass she picked.

Cleanly Habits.

I find that a well fed goat is very cleanly about what she eats and will not readily eat any tainted or soiled food. She is also careful about lying down where she might soil herself preferring, if allowed the chance, to lie on a box or in the manger. She is also prohibited by nature from switching dirt into the pail with her tail while you are milking.

In fact, you may safely inform those of your readers who are prejudiced against the goat, just because she is a goat, that with the same amount of care they will get much cleaner milk from the goat than from a cow. I could not detect any great difference, except that it is probably sweeter in the flavor or odor of the goat's milk, when fresh, from good cow's milk. There seemed to be a more distinct flavor, though nothing objectionable after it had stood for some time. But since the cream does not readily separate from the goat's milk, unless it is scalded soon after it is drawn, there is little necessity for keeping it.

That goat's milk is a most valuable food for infants and persons with weak stomachs is the verdict of almost every one who has given it a fair trial, and I could cite some strong cases to prove this, but this article is already too long so must close.—James H. Hester, V. S., Santa Barbara.

POSSIBILITIES FOR LIVE STOCK

breeds of the mutton class will increase and the wool and mutton bring in more to this State than it does today.

Goats.

Goats will increase in popularity. The Angoras already have a strong hold with many who have found them profitable.

The latest favorite, which is creating great interest, is the milch goat. With the large number of sanitariums located in the State, and the

"ROCKY MOUNTAIN CANARIES."

We don't know as there is great money for Californians in breeding the ever patient and faithful burro, but here is a suggestion from the Denver Field and Farm:

It does beat the Dutch how the call for Rocky Mountain canaries has put the dealers on the run this spring. Within the past sixty days we have had quite a number of inquiries from Eastern resort keepers asking us to find them burros in carload lots and the job has not been such an easy one by a long shot. One big publishing house in Ohio writes us that they want from ten to twenty carloads of sunset warblers for premium purposes and we do not know where to turn to find them. A good many people have evidently overlooked the breeding of the tenderfoot's pride for the Eastern people have suddenly awakened to the utility of this patient little beast of burden as a pleasing curiosity, and

**A Hungarian Pony**

the folks down East are always crazy over anything that may look like a curio. So far as we are concerned they can have all our long-eared donkeys for since the prospecting business went out of style and the wood has disappeared from the mountains we have very little use for them except at a few resorts where the visiting tenderfoots love to linger, and of these Manitou is the most iridescent specimen.

BUTTER AND SUBSTITUTES.

From a circular issued by Pennsylvania dairymen, we quote:

The total value of dairy products in the United States, in the year 1899, according to the last U. S. Census Report, was \$506,663,289. To properly safeguard an interest so important to the farmers of our country, it is absolutely necessary that the national laws which deal with the manufacture and sale of oleomargarine, butterine, renovated or process butter and adulterated butter shall be radically and speedily changed.

Farmers, dairymen and others interested in pure butter must endeavor to obtain remedial national legislation in order that the manufacturers and dealers who handle oleomargarine and other butter substitutes shall discontinue to market these products as pure butter, which it seems has been customary for many years, on account of flaws in the national statutes that were erroneously believed to properly control the manufacture and sale of these commodities.

It is important that all who are concerned in the prosperity of the dairy interests shall, without delay, appeal to the President of the United States, the United States senators and members of Congress to remedy defects of the national laws. The changes must be made if the most

**The Home Tool Kit**

When you want a hammer or a hatchet or any tool for any work, you know and everyone knows that the right way to be sure of satisfaction is to order Keen Kutter tools.

But when you want a complete set of tools, instead of buying one tool at a time and never having the right tool when you want it, order one of the

KEEN KUTTER TOOL CABINETS

Every tool has its own place in the cabinet and every tool belongs to the famous Keen Kutter brand, which means they are the best you can buy and that they are guaranteed perfect. Keen Kutter Tool Cabinets are made in various styles and sizes at prices ranging from \$8.50 to \$85.00. If not at your dealer's, write us.

MORE FRUIT WITH LESS LABOR

You can positively insure a larger crop, clean fruit and healthy trees at a saving of fully one-third the labor ordinarily required and with a much less outlay of time and money by using a **Bean Magic Spray Pump**. The reason is because it sprays thoroughly with high, even pressure, but the operator is working against only one-half the pressure indicated on the gauge. It's on account of the spring which makes the Magic Spray Pump the easiest running, most perfect spray pump ever made. No other pump can compete with it in the essential points of quality and durability, and we challenge comparison with all other makes regardless of price or construction.

Bean Magic Spray Pumps

are the result of careful study and experience in pump manufacture. We have no other line. We are specialists in pump-making, and the name **BEAN** on a spray pump or appliance is a guarantee that it is the best that money and brains can produce.

The most successful raisers of fancy fruit agree that spraying is the only and most effective method of securing the best results. The increase in profit from securing fancy fruit will alone soon pay for the outfit. Whether you have a large or small orchard you cannot afford to be without a Bean Magic Pump.

We have samples of these Pumps in stock, and will be pleased to show them to you.

WITH A SEIVERT OIL BURNER

You can burn 100,000 feet of air with every 120 gallons of oil; this means perfect combustion. To burn more than 100,000 cubic feet of air with 120 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel. The only safe and reliable burner on the market. Send for full particulars.

SIEVERT OIL BURNER CO. 1061 No. Alameda St., Cor. Main and Ord Sts., Los Angeles, Cal.

California Horticulturally

PROSPECTIVE PLANTINGS.

FROM all present appearances there will be very heavy plantings of table grapes and peaches in the northern counties this coming season. Nurserymen report that they have greater orders for these two fruits than for any others, and almost than all others combined. Table grapes, especially Tokays, have paid enormous returns for the past three years and there is still an increasing demand for them in the Eastern market. The question of overproduction is somewhat raised, but while there is a limited area upon which the best table grapes can be grown and an unlimited demand from the whole country for them, there is little danger of overproduction. California produces the best table grapes; the choicest of these are the product of a comparatively small part of the State. The United States now has close upon 100,000,000 people, and they all like grapes. The question is not, therefore, one of overproduction, but whether we can supply the constantly growing demand. The whole country from Lodi to Sacramento is gradually being converted into one vast vineyard, the greater part of it table grapes, and those who have them for sale have been making money, as much as \$300 per acre net in many cases.

Peaches have also commanded big prices for several years, this year

ranging from \$35 for frees to \$60 for clings, and those who had this fruit have got a good bank account. It is true that the shortage in this crop had some bearing on prices, but for all that the prices have been high and will probably remain good for most of the time to come. The crop of early peaches in the upper country was very light, but the late fruit turned out better. It is this demand, with the big prices, which have given such an impetus to the planting of grapes and peaches this year, coupled with the probability that there will always be a good demand for them.

THE FRUIT GROWERS' CONVENTION.

The people of Marysville are taking hold of the work connected with the next Fruit Growers' Convention with a zeal that promises success. Among other matters, an entertainment has been undertaken by the ladies, to which one evening will be devoted; one afternoon will be set apart for a trip over the new electric lines which connect Marysville with all the outer world. A splendid programme is now under preparation, which will depart somewhat from the old order of things and be of greater interest than usual. Arrangements have been made for securing excursion rates from the railroads, and a committee will look out for seeing that all visitors are well housed while there

The Galloway

Continued from Page 473

good demand at private sales. Some are even passing the \$1000 mark.

Encourage High Breeding.

In frankly asserting my preference for this breed and earnestly pushing their claims for superiority, I do not ignore the fact that there are grand qualities in all the beef breeds. Pure blood is to be as eloquently praised, as scrubs are to be persistently fought. How many times in recent years, in discussing the merits of the various beef breeds, have we heard a statement something like this: "Yes, the Herefords are the best cattle on the range, but on our farm the Blacks and Shorthorns are the favorites." This statement is always made by a Hereford ranchman or some one that is just guessing at his mark. First, the Galloways are better rustlers than any cattle. They are always on the hunt for something to eat no matter what the condition of the weather is.

The sires are prepotent; no matter what the dam is the get will be hornless, and nine-tenths of them will be black. This being the case, you can grade up a mixed herd of cattle with a Galloway bull faster than any other breed that exists. All will be black and look alike; they are always good sellers.

It is yet possible that the Galloway will gain supremacy on the range. They are wonderfully hardy, for their lung power is great. Its coat is a magnificent robe of long, black hair, which has taken the place of the Buffalo robe in the markets of the world.

It has a fearless, independent mind, yet it is a docile animal and satisfactory to handle.

A Good Cross.

Lastly, the Galloway cow crossed with the white Shorthorn bull produces the most famous types of feeding steers known to the records of the beef-producing world. I refer to the "Blue-Gray" cross-breed, which usually top the British markets and are always looked for at a premium by feeders.

Not a Dairy Type.

While we don't claim a dairy breed, we do claim their milking qualities as good as the Angus, Hereford and some Shorthorns. They always raise a fine calf.

Their flow of milk is celebrated for quality not quantity; therefore, you never see spoiled udders on the range. In 1902 the Galloway cow, Lady May, No. 11,562, was sold for \$7.25 per cwt.—the highest price ever paid for a cow of any breed on the Chicago market.

They do not look large, but that is because they are all meat, besides, the modesty of their black dress has the effect of making them look smaller than they are. Everybody knows the same woman dressed in black appears to have a smaller waist than when dressed in white. So with the Galloway when the black robe is taken off.

The Galloway goes on the scales with as much dead weight as her white or red cousins, and for crossing purposes the Galloway is unexcelled. I have some crosses from full blood Jersey cows and they are black and polled. One can scarcely tell them from full blood Galloways.

Concluding, I would say, when banks and other business fails, the best investment in the land will be the Galloways.—John Troup, Mgr.

TUNE THE OLD COW DIED ON.

Home from his work came Farmer John,

One summer afternoon,
Sat him down 'neath the maple tree;
And he sang himself a tune.
He sang till the cows come running up

And round him formed a ring;
For ne'er before, since the world began,
Had the farmer tried to sing.

Chorus—

And this is the tune, ri-fol-dol-dol,
Sung by Farmer John,
Ri-fol-dol-dol, ri-fol-dol-da,
'Tis the tune the old cow died on.

The oldest cow in the farmer's herd
Tried hard to join that song,
She tried so hard, but she could not sing,

Tho' her voice was loud and strong.

The farmer laughed till the tears rolled down

His cheeks like apples red.

The cow she tried, but she could not sing,

Till she dropped right over dead.

Chorus.

Farmer John had an inquest held,
To see what killed that cow,
The jury sat, and the verdict brought,

Which I mean to tell you now.
They said his cow would be living still,

To chew her cud in glee,
If farmer John hadn't sung that song

Down 'neath the maple tree.

Chorus.

A FRIENDLY WOODCHUCK.

VERY EARLY last spring a woodchuck poked her black nose from the mouth of the burrow in which she had spent the winter, and blinked her little, round black eyes in the sunlight. Then she came out and lay basking on the mound of hard earth before her doorway. She looked very weak, and she was certainly dreadfully thin. Her grizzled pelt hung loosely on her bony frame, and when she moved it was with a languor not usually observed in woodchucks. The fact is that she had but just awakened from an all-winter sleep; and as she had fasted since the previous October she was not only drowsy but famished. But perhaps it was disuse as much as anything else which caused the evident weakness of her limbs, for as she moved about a little, stretching herself in different directions, it could be seen that she was gaining strength with every movement. By and by she turned around and, putting her head and shoulders into the burrow, began raking out with her forepaws all the earth, leaves and grass with which she had blocked the entrance in the fall. With this rubbish came many living things—black beetles, a hornet and a large green frog, all of which had been sleeping away the winter at the woodchuck's door.

After she had made a neat pile in front of the burrow, and covered it up with fresh loam from the tunnel itself, the woodchuck had strength to go off in search of some food. There was very little to get just then, for the winter had barely gone, but she found a little patch of a large rock, a tuft or two of coarse grass near a spring, and with these and a few mouthfuls of bark from a nearby tree she managed to make a moderate breakfast. Then she returned to the burrow and stayed there for two days. By that time the grass had

grown considerable and the woodchuck had less difficulty in getting a meal. And every morning after food became more plentiful the clover appeared in larger and thicker patches, and gradually the wrinkles in the grizzled skin of the groundhog began to disappear.

One morning, after the little rodent had had her morning meal of clover, and she was taking a sun bath on the mound of earth in front of her doorway, some small object struck the mound about six inches in front of her face, and threw a pinch of the dirt sharply in her eyes. She did not know what the trouble was, and she did not stop to find out, but pitched headfirst into the burrow and stayed there. As she disappeared, a small boy, brandishing a Flobert rifle and followed by a little yellow dog, jumped from behind a hillock and ran up to see how near he had come to the chuck. He pulled a grimace when he saw where his bullet had pitted the earth, reloaded his weapon, and went back to his hiding place. But the woodchuck, not being quite a fool, remained where she was safe until the boy became tired of waiting and came back to the hole, the yellow dog still at his heels. The boy now picked up the dog and put its nose to the mouth of the burrow, and after a few words of encouragement the cur, which had more assurance than wisdom, plunged into the black hole. The boy sat down on the mound of earth and yelled "Sic 'em Prince!" and for about a minute no doubt Prince was doing as he was bid. After that, it seems that the woodchuck did most of the "sickening," for the dog backed out of the burrow with two terrible cuts on his head, and howling in a most unprincipled manner. Then, tucking his tail as far between his legs as he could get it, he made for home by a short cut and at his very best pace.

Not long after the woodchuck appeared at the mouth of the burrow with a family of five little ones. They had been born some time before, but this was their first appearance in the open. They were pretty, dark-eyed, soft-coated little fellows, ready to topple back again out of sight at a sign from their mother. Every morning now the whole family might have been seen moving through the grass to the spots where the clover grew the thickest. For a short time they lived in peace but one evening they made themselves a powerful enemy by journeying into the next field and eating off close to the ground three long rows of young peas. The owner of the peas said very little, but he drove to town and brought back a stick of dynamite, which he thrust far into the burrow. A minute later there was a muffled boom, and the farmer went off, satisfied that he would not be bothered again by that family of woodchucks. But in the evening a cautious gray head was thrust from the mouth of the hole, and soon our old woodchuck crawled from her home and made off slowly across the field. The dynamite had killed the young ones, but the mother had been only stunned. She went directly to an old burrow which she had occupied two years before and next morning there was a large heap of fresh earth in front of it. She lived there quietly until the lat-

ter part of the summer, when, returning after an absence somewhat longer than usual, she found the entrance to her home barred by a snarling black head, with a white stripe down the front. The premises had been seized by a skunk, and the woodchuck was obliged to seek a residence elsewhere. She started to dig a fresh tunnel on the other side of the field and for hours she threw out the soil with her strong claws. The following afternoon she was still at work, when the figure of a man, in brown overalls, crept under the brow of the hill and lay down behind a rock at the top. For half an hour the woodchuck worked on; at last she appeared at the doorway for a breathing spell. A little curl of white smoke leaped from behind the rock, there was a sharp report and the woodchuck dropped back into a newly made grave.—N. Y. Sun.

BOILING AND ROASTING MEATS.

Inattention to the temperature of the water and too early application of salt cause great waste in boiling meats. To make fresh meat rich and nutritious it should be placed in a kettle of boiling water (pure soft water is best,) skimmed well as soon as it begins to boil again, and placed where it will slowly but constantly boil. The meat should be occasionally turned and kept well under the water, and fresh hot water supplied as it evaporates in boiling.

Plunging in hot water hardens the fibrine on the outside, encasing and retaining the rich juices—and the whole theory of correct cooking, in fact, is to retain as much as possible of the nutriment of food. No salt should be added until the meat is nearly done, as it extracts the juices of the meat if added too soon. Boil gently, as rapid boiling hardens the fibrine and renders the meat hard, tasteless and scarcely more nutritious than leather, without really hastening the process of cooking, every degree of heat beyond the boiling point being worse than wasted. There is a pithy saying: "The pot should only smile, not laugh." The bubbles should appear in one part of the surface of the water only, not all over it. This differs from "simmering," as in the latter there is merely a sizzling on the side of the pan.

Salt meat should be put on in cold water so that it may freshen in cooking. Allow twenty minutes to the pound for fresh, and thirty-five for salt meats, the time to be modified, of course, by the quality of the meat.

A pod of red pepper in the water will prevent the unpleasant odor of boiling from filling the house.

To Roast.

To roast in oven, the preparations are very simple. The fire must be bright and the oven hot. The roast will need no washing if it comes from a cleanly butcher; wiping with a towel dampened in cold water is all that is needed; if washing is necessary, dash over quickly with cold water and wipe dry.

If meat has been kept a little too long, wash in vinegar, wipe dry, and dust with a very little flour to absorb the moisture. Place in pan, on a tripod, or two or three clean bits of wood laid crosswise of pan to keep it out of the fat. If meat is very clean, add a teaspoon or two of water; if fat, the juices of the meat will be sufficient, and the addition of the water renders it juiceless

and tasteless. While the meat is in the oven, keep the fire hot and bright, baste several times, and when about half done turn it, always keeping the thick part of the meat in the hottest part of the oven. Take care that every part of the roast, including the fat of the tenderloin, is cooked so that the texture is changed.

Fifteen or Twenty Minutes to the Pound.

If the fire has been properly made, and the roast is not large, it should not require replenishing, but, if necessary, add a little fuel at a time, so as not to check the fire instead of waiting until a great deal must be added to keep up the bright heat. Most persons like roast beef and mutton underdone, and less time is required to cook them than for pork and veal or lamb, which must be very well done. Fifteen minutes to the pound and fifteen minutes longer is the rule for beef and mutton and twenty minutes longer for pork, veal and lamb. The directions for beef apply equally well to pork, veal mutton and lamb.

Underdone meat is cooked throughout, so that the bright red juices follow the knife of the carver; if it is a livid purple it is raw, and unfit for food. When done, the roast should be a rich brown, and the bottom of the pan covered with a thick glaze. Remove the joint, sift evenly over with fine salt, and it is ready to serve. Never salt before or while cooking, as it draws out the juices.

The Gravy.

To prepare the gravy, pour off the fat gently, holding the pan steadily so as not to lose the gravy which underlies it; put the pan on the stove, pour into it half a cup of boiling water (vary the quantity with the size of the roast; soup of any kind is better than water if at hand) add a little salt, stir with a spoon until the particles adhering to the sides of the pan are removed and dissolved, making a rich, brown gravy (some mix flour and water and add as thickening.)

Basting.

In roasting all meats, success depends upon basting frequently (by dipping the gravy from the pan over the meat with a large spoon) turning often so as to prevent burning, and carefully regulating the heat of the oven. Allow fifteen to twenty-five minutes to the pound in roasting, according as it is to be rare or well done, taking into consideration the quality of the meat.

Roasts prepared with dressing require more time. In roasting meats, many think it better not to add any water until the meat has been in the oven about half an hour, or until it begins to brown.

THE SOAPBOXBIL.

I just don't like you Tommy Green! The worstest boy I ever seen! You said I'd ride in your Soapbox-bile, And have ice cream, if I didn't squeal, And now you go a-slyin' by, A-lookin' out of t'other eye.

Citrus Market

LOS ANGELES, Nov. 12, 1907.

Orange shippers are in trouble over the car shortage. If cars could be had at this moment there would be approximately a hundred cars a day going out to supply the Thanksgiving trade. As it is, less than half that number are being shipped.

Central and Northern California are suffering worse than the Southern part of the State.

Tulare county alone should be forwarding approximately 60 cars daily, but as a matter of fact is shipping practically nothing. Southern California with three roads as an outlet has at this time less trouble.

Prices are uncertain. But few f. o. b. shipments are made so that until returns come from the East, there will be uncertainty as to prices. Were it not for the financial flurry, there is no reason to question that the strong condition at the close of the old year should prevail now.

Lemons are somewhat on the slump. Fancy goods find ready sale at moderate prices, but culls and lower grades go begging. There is no immediate prospect of the market recovering.

HOLTVILLE, IMPERIAL VALLEY, CALIFORNIA.

We beat the world six weeks on grapes, cantaloupes, asparagus and fruits. Pasture for stock all year around.

This means high-priced land. Buy now while cheap. **WHITE & BRIDENSTINE**, Holtville, Imperial County, California.

It's what a fellow doesn't know about a girl that causes him to fall in love with her.—Philadelphia Record.

For Mehrling Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

FINE ORPINGTONS.

One of the most enthusiastic breeders of Orpingtons in this State is W. S. Sullivan of Lynews. The Cultivator recently spoke of his great display at the State Fair, and he did have some beauties there. Doubtless, he is making another winning this week at the San Jose poultry show.

Sullivan knows how to grow winners. Better still, he knows how to produce that not only as a good show-er but as well a good doer.

THE PIONEER HATCHERY.

E. E. McClanahan and D. E. Doke have combined forces in the baby chick business and will run a chick store at 711 S. Main street, Los Angeles. The combined sales of these two firms the past year was close to 90,000 baby chicks, not to mention the ducks, turkeys, goslings, etc., that were sold. Both men are well and favorably known, and are in touch with all thoroughbred egg men and you can get good stock. We wish them success.

SEND IT TO CANADA.

I consider your paper a most excellent paper and would not know how to make any improvement on it. I am going to send several of the last numbers to some of my friends in Canada.—Wm. Hausler, Santa Ana.

A GREAT HELP.

In sending in remittance for the Cultivator, Mrs. H. H. Morgan, of Ontario, writes:

My husband was always a great reader of your paper, and since his death last January I have found it of very great help to me in carrying on his work.

Percy L. Harley proprietor of Feather Farm, Redlands, Cal., has just returned from a three months trip through the East, where he had the pleasure of visiting many of the largest and most progressive poultry plants, and especially those interested in Orpingtons. He informs us that after carefully inspecting the best birds on these farms he is more than ever convinced that California has just as good birds as can be found in the East.

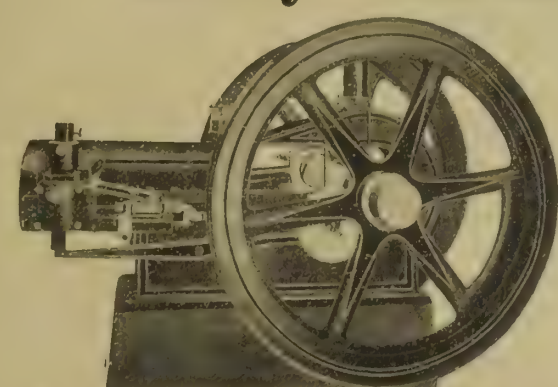

Mr. Harley has been very successful this season not only in quantity but quality, and has some extra choice birds for immediate shipment. Those wishing birds will get the benefit of Mr. Harley's experience.

R. J. Hunter, of Gridley, is among those who are doing a great deal toward furthering the interests of the small fruit growers. He has ten acres of land on which he is not only making money by raising berries, but he is constantly experimenting with new varieties and propagating the standard varieties under different conditions of soil treatment and varying methods of pruning and cultivation. He is issuing a creditable little catalogue that he will be glad to mail to any who make inquiries. Address R. J. Hunter, Oak View Berry Farm, Gridley, Cal.

Our readers are advised to send to the Enterprise Manufacturing Company of Pa., 240 Dauphin St., Philadelphia, for a free copy of their new book, "The Enterprising Housekeeper." The regular price of this book is 25 cents, and it is well worth it, but any of our readers can secure a copy free on request. Besides hundreds of new and unusual recipes, it contains a great deal of valuable information and helpful kitchen suggestions.

Success Plow

A
Frameless Plow
That Will
Last a Lifetime

The Best and Cheapest Plow is the Success. Why?

Because it does the same work as plows that cost a great deal more.

It costs less than higher priced plows because it is made of fewer parts.

On account of its having fewer parts it won't get out of order.

Plows get out of order because they are complicated. The Success isn't complicated—it's very simple.

A plow that won't get out of order is what you want, isn't it? You would call such a plow **strong and durable**.

That's why the Success Plow is named "**SUCCESS**."

Being less expensive than others, doing first-class work, possessing the essential qualities of strength and durability, the Success deserves all we claim for it. No use to ask now why it is the cheapest.

The best is always the cheapest.

Equipped with the best bottoms made; adjustable front axle; dust-proof removable wheel boxes; adjustable rear wheel; easily set for any depth; works equally well with large or small horses; has light draft and is easily operated—a perfect plow.

Effects of the California Peach Blight

A Dread Disease of the Peach Which
Attention at the Proper Time Controls

THE disease which forms the subject of this bulletin has come to be a well-known factor in peach growing in practically every part of California where the fruit is extensively grown. While its general occurrence has been experienced only during the past few seasons, the disease has become so abundant and its effects so extremely disastrous that almost every peach grower has come to know it and see the necessity of finding some immediate preventive treatment in order to save his trees from actual destruction.

The present publication aims to present the results of three years' experience and experimentation in the control of this trouble, showing the almost absolute success with which the disease has been controlled by treatment. The work has been unusually satisfactory in this respect, and it has apparently been fully demonstrated that by proper attention the grower can fully protect his trees and crop from the effects of the blight at a minimum expense.

This disease appears to have been present in the State for some time. Professor Pierce records it as occurring previous to 1900, and some growers recognize the trouble as one with which they have been familiar for a number of years. It was in the spring of 1904,

Twigs from Sprayed and Unsprayed Trees, 1907

Courtesy California State Experiment Station
Peach Orchard Showing Typical Blight Effect

however, that the "blight" began to attract much attention. The injured condition of many trees at that time was very evident. This was particularly the case in the Sacramento, San Joaquin and Suisun valleys. A spotting, gumming and death of the buds and twigs, particularly on the lower part of the trees, appeared in some abundance at that time. The winter of 1905 was a very wet one, and the blight increased greatly that spring. By the middle of February, 1905, it was evident in many places that a fresh infection had taken place and the growers began very generally to see the necessity of finding means of controlling this new disease. Since another even more serious orchard disease, the pear blight, was making its first appearance in much of the same territory at the same time, the peach trouble was considerably overshadowed for the time. The writer first became familiar with the disease as a serious matter in the fall of 1904, since which time the matter has

Continued on Page 497

Coulson's Improved Mash Egg Food

Takes
Less
Feed

Makes
More
Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of COULSON'S NO. 3 CONDITION POWDER will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time they must have the best food you can give them from the commencement of the molt. You will find COULSON'S IMPROVED MASH EGG FOOD is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-Pound Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

COULSON'S IMPROVED MASH EGG FOOD is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

A Menace to Peach Industry Controlled

The State University Issues a Comprehensive Bulletin by Prof. Ralph E. Smith, Who Has Been Assisted in Many Experiments by E. H. Smith, T. F. Hunt and B. J. Jones

WHEN, in 1904 and 1905, the peach blight began to be abundant enough to attract notice, it was evident to all who observed the matter closely that the usual practice of peach spraying in February or March was too late to check infection by this disease. Twigs which were sound and healthy in December were found to be spotted with infection by the first of February. Even with the heaviest and most thorough spraying with Bordeaux mixture, or lime, salt and sulphur, applied at the usual time, the gumming produced by the blight would be

respect to this disease. One orchard, sprayed mostly in December, but finished out late in January, showed a decided difference in the two portions. Spraying in December was perfectly successful; in January partially so, and in February and March without effect on this disease. The blight was so bad in unsprayed or late-sprayed orchards, with the crop and foliage almost entirely gone, and all the growth on those sprayed in December perfect, particularly the lower, inner, blight-susceptible fruiting twigs, that one seldom sees so striking a contrast in the treatment of any plant disease. Abundant comparison was available between trees of the same variety, age and condition.

Effect on Curl Leaf Equally Good.

The writer took some pains to note in this connection the effect of this early spraying on curl leaf, inasmuch as any peach treatment must take this disease into consideration. So far as could be judged, the effects were equally good, and the disease controlled as well as by the usual later spraying. The fine condition of a block of December-sprayed Susquehannas was especially noticed, while unsprayed trees on this and even less curl-susceptible varieties were badly affected by curl leaf wherever the blight fungus had left any leaves on the tree.

To Summarize:

Unsprayed trees were very badly affected by blight and curl leaf.

Trees sprayed in December were free from any disease.

Trees sprayed late in January were somewhat affected by blight, but free from curl

leaf.

Trees sprayed in February and early March were free from curl, but no better than the unsprayed in regard to blight.

* * *

Time of Spraying for Blight Control.

September was too early and February and March too late. Spraying in the latter part of October seemed effective, and from then on to the middle or last of December the best results of one application were secured in preventing blight infection.

The attacks of curl leaf complicated matters. In many cases a complete blight control, obtained by early spraying, was nullified by unchecked attacks of the other disease. Spraying in November and December did not altogether hold the curl in check, while the February and March applications did so perfectly. It, therefore, seems best in the future to advise two sprayings, one early and one late, to insure freedom from both diseases.

As a third peach pest, the peach worm may be controlled by spraying with lime, salt and sul-

phur just before the buds open, a treatment that is equally efficacious for curl leaf, we suggest this for the second spraying rather than Bordeaux mixture.

Kind of Mixture.

Practically all these results refer to Bordeaux mixture. We have reason to feel sure that lime, salt and sulphur spray would give equally as good results, but for the blight alone the more easily prepared Bordeaux is usually preferable.

Proportion of Mixture.

We have not laid great stress on the exact formula for the Bordeaux mixture to be used. Where the mixture was properly prepared very little difference in the results has appeared, whether it was 20-20-200, 30-35-200, or very much stronger as some have used it. Ordinarily, the 20-20-200 formula is probably strong enough and affords some saving of material over a heavier application. A mixture containing more copper and lime remains longer on the tree, however, is not as quickly washed off by rain, and shows more plainly on the tree just how thoroughly it has been covered. We would, therefore, advise the use of the lesser strength only when materials are very high and scarce or where the workmen are particularly adept in applying the spray perfectly. For average conditions we prefer the 30-35-200 for the early application.

Preparing the Mixture.

The preparation of Bordeaux mixture has been described almost too frequently to need repetition. The lime should be of the best and per-

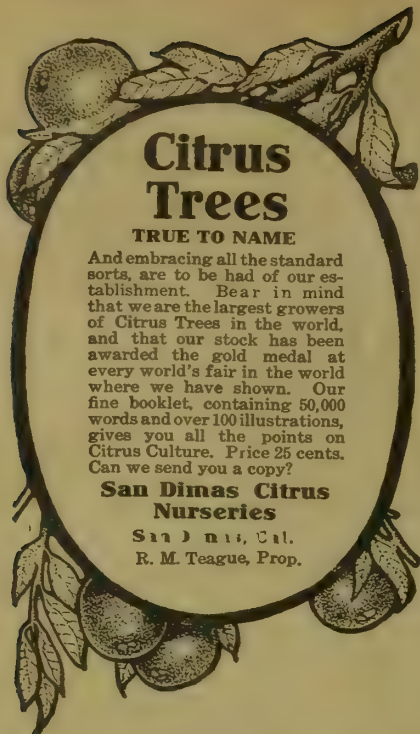

Peach Twigs Affected by Blight

Left Side of Tree Sprayed in December, 1906, Right Side Unsprayed

fectly unslaked, and slaked in a considerable amount of the water and stirred and strained to make a perfectly smooth whitewash. The bluestone is to be dissolved in water, a stock solution of known strength being most convenient. In mixing the two, plenty of water should be used to keep them well diluted, and the mixture well

With the Citrus Growers

THE ORANGE IN JAMAICA. SEEDLINGS DO THE BEST.

BUDDED orange trees are dying out by the scores in some groves, while the good old seedlings in the pastures go on bearing merrily, says a correspondent in the *Journal of the Jamaica Agricultural Society*.

Although the practice of using budded citrus trees has become generally adopted in the island, there are still a great many who look askance at the innovation and remain staunch in their belief that seedlings make the most reliable and best trees. They point to the seedling orange trees, self-grown, half-wild, unattended, uncultivated, which have been bearing steadily as far back, perhaps, as they can remember; strong, up-standing, healthy trees, proof against scale insects, against drought, or wet, die-back or foot rot, blight or beetles. As they compare such (note the such) seedlings common everywhere in woodland and pasture, with certain budded trees in certain groves (note the certain) grown from seed, sown in beds, transplanted, and well tended, then transplanted to a nursery, budded, kept clean, and then planted out in a grove, where they are kept hoed fairly clean, forked around, limed, perhaps, and manured, and yet in two or three years, snails and beetles attack the leaves, grubs eat the roots, scale infest the whole tree, so that washing and spraying are begun as a necessary part of the cultivation or else the trees die out. Even with all such attention many trees die. This is all apparently plain, as is pointed out by many who do not believe in new-fangled things (although the "new" things are often methods as old as the pyramids,) and often the planter of budded trees can only feebly excuse himself to the enthusiastic advocate of things as they were and seedling trees, by saying he could get a crop in three or four years against the seedling man's seven or eight, and that his will come true while the seedling tree may turn out half sour.

The Why of It.

Now let us bring common sense only to bear on this subject, and leave out all thought of mystery and magic, fads and fancies, theories and tall talk.

The stout seedling tree in the pasture, never cultivated, yet proof against disease, and always bearing well, has germinated as the fittest of a million or more of seeds deposited on the soil around, had grown from thousands that spring through the soil, has survived hundreds of young trees that grew up, has alone reached bearing of scores of its companions, has kept on bearing of dozens that bore fruit and afterward died out. Between this stray tree and the neighboring strong orange tree, may be a space of 50 or 60 feet, and between, bushes of many kinds, a pear, a breadfruit, an ackee, and so on. It invariably happens where there are clumps of seedling trees or two or three close together, that they are infested with parasites and pests of some kind, and are poor trees, only their great grip of the soil upkeeping them. Almost every tree, or plant, has its peculiar pests, and, as a rule, these do not prey indiscriminately upon plants of opposite characteristics, so that when there is some intimate scale on an orange tree, and that

tree is well separated by other trees from neighbors, there is not much chance of one particular pest spreading fast or gaining on the more voracious species of ladybird. There may be other kinds of our trees, insects or birds, unknown to us which get scant mercy at our hands.

Penny Wise.

Is not all this worthy of special study and investigation by an entomologist? I dare say in saving the cost of an entomologist we are losing one hundred times as much in the time and labor involved, in every man attempting to being his own doctor of his trees and still losing them. We have doctors for men, another branch for horses and cattle, so why not have a plant doctor? It is hard to see scores of trees that have just reached the bearing age dying out; but it is just at the stage when the great call is made on the constitution of a tree that its weaknesses become apparent, and it cannot stand the strain. The whole trouble, we think, can be traced. It is not in the fact of budding or grafting, for the bud is part of another tree, and if there is any weakness in its constitution, that can only affect the top of the tree, while our most serious trouble is at the roots, and these roots are those of the stock, grown from a seed. It is, in fact, seedling sour orange trees that are dying out in our groves from root troubles, exactly what the advocates of seedling trees forget.

Same Condition for Both.

The sweet seedling trees in woodland and pasture are subject to exactly the same, and to all diseases that the budded trees in groves suffer from, and every day some are dying out; you can see them diseased and decaying on every estate, only certain of the very fittest disease-proof surviving, as we have pointed out, and there is in every cultivated grove always the same thing, certain stout, strong healthy trees, that cannot be killed. But never having had much, if any, money spent on them, and little or no care, these dead or dying seedlings are not particularly noticed. Still they do not suffer as much from disease of the roots as do budded trees that is evident; wild, self-planted seedlings are diseased above ground, seldom below, while it is the opposite with most of the budded trees, the growth of which is so satisfactory in many places. Is it not evident from this that there is some fault in the transplanting and in the treatment generally of these grove trees? The fact is, the whole operations from planting the seed in a nursery or have been bad. The self-sown seedlings select themselves by the fittest surviving; but no selection has been made by the planter, as a rule. He has not chosen the sour orange tree that was perfect and free from disease, and well loaded with large fruit; nor has he chosen the plump seed from these fruits.

We question whether, in transplanting the small seedling tree from a bed to a nursery, the treatment has been such as could be calculated to make them strong and vigorous. Both in nursery beds and in groves—and generally with all our horticultural operations—the ground has been too quickly and roughly prepared. It is mainly of fallow ground, which is cleared, hoed

ing and trees put in all in a week. The soil with this treatment cannot be in a condition for tender trees to make growth—tender, for all transplanted trees are tender, and the soil must be of the sweetest and finest for the cut surfaces to head and put forth a fresh root. It is feeding food material, and they consequently get a bad start. But a seedling never interfered with grows slowly and readily, its tap root is deep down; it puts forth a fresh root, it is seedling the time through a hundred years. Our treatment, therefore, has not been tender enough, has been too rough and ready. When deep planting is added to this, the death of the tree is certain.

More Careful.

What is required is to plant fewer trees, and take more time in all the cultural operations from the beginning, for what does it profit to have ground cleared, holes dug and 5000 trees looked over that are bound to give trouble and anxiety and loss later, when 1000 trees very carefully and minutely looked after will probably give as large a return. There is more money in 100 trees bearing 1000 oranges each than in 1000 trees bearing only 100, and poor ones at that. We also want a special study made to find the most deadly enemies of our greatest pests; what, for instance, would prey most upon figs, beetles, and what upon their larvae, the oily "makakas"? At present the only enemies to the "makaka" we know of are poultry and young pigs that loose in the grove, and these root and scratch these grubs up. If the roots are thoroughly healthy the tops will never die off mysteriously. Praying the foliage and branches for all sorts of diseases is not an unneeded blessing if you kill off the hybrids which are so valiant in our interests. Without healthy roots there can be no healthy tree. The proper preparation of the soil and the careful planting of the young trees are things to be looked upon with respect. To dig a row of holes in raw hills and get any odd worker about the place to stick the trees in up to the bud as fast as the holes were dug, is the general style of planting some of these very trees that are now dying out. There is a science in planting trees that may not be learned in a day, however easy it seems.

FLORIDA CITRUS CROP.

In the Chicago-Packer's report of citrus conditions, we note a general shortage. From the large number of estimates sent in from various sections, we quote these few:

Plant City.—The orange crop is very short in this section. Estimate of the State crop at 2,500,000 boxes. Most fruit of late bloom. No sales have been made yet.

Hobe Sound.—About 75 per cent of next year's crop of oranges and grapefruit here. The quality is good. No offers or sales have been made yet. Shipping will begin November 5.

Wauchula.—There is about half an orange and grapefruit crop in this section. Quality is good and shipping will begin in a few days.

Williston.—The orange and grapefruit crop here is about one-quarter of last year's yield. There will be very few for shipment and I think the local trade will take about all in Levy, Alachua and Marion counties.

Raleigh.—There is a fine lot of

fruit this season in Raleigh and Mrs. Fobs here is selling oranges every day and when brought to the market obtains fine prices for them.

Claremont.—The orange and grapefruit crop in this vicinity is favorable. The quality is the best. Estimate the crop of the State to be 2,500,000 boxes. Growers are asking \$2 to \$2.50 for oranges on the trees. No offers or sales have been made yet. Shipping will begin about December 10.

Electra.—Oranges and grapefruit in this vicinity are the same as last year. Quality is good. Think the crop of the State will be very light. No offers or sales have been made yet.

Boardman.—The orange crop here is not so large as last year, but the quality is good. There were 50 cars shipped from here last season, but there won't be quite so many this year.

Indianola.—The orange and grapefruit crop is here about the same as last year. Quality is above the average. Growers are asking \$1.50 to \$2 per box on the trees for oranges. Shipping will start November 15.

THE NEW HARDWARE ENCYCLOPEDIA.

The new General catalogue just issued to the Retail Hardware Trade by the Simmons Hardware Company is the greatest achievement of its kind in modern times and has rightfully been called "Simmons' Hardware Encyclopedia."

Each copy contains 4200 pages, 21,535 illustrations and 79,137 different items, and weighs 20 pounds, the entire edition weighing more than 250 tons. It required 16 carloads of paper, 18½ tons of tar board for binding and 58,000 square feet of binding cloth to make up this catalogue, in which the printing presses have deposited 1½ tons of ink in printing.

Not only does this vast catalogue eclipse anything ever before attempted in point of magnitude, but it represents perfection in every detail. The five-colored productions of Keen Kutter goods are beautiful in appearance and perfect in detail, illustrations are correct, descriptions are concise and complete, classifications of goods clearly defined, and, as a whole, it is safe to say it is the greatest Commercial Catalogue of any kind the world has ever seen.

This Catalogue is issued exclusively to the Retail Hardware Merchant for his use in picturing and describing to the public any items which might be wanted but which he would not usually carry in stock, and by means of it the retail merchant can supply anything on earth that would be in stock in the largest retail hardware store in the world.

It is well worth the time of any man, woman or child to call on a local dealer and ask to see a copy of the "Simmons' Hardware Encyclopedia."

"Really," remarked the lazy cad, "I've been wondering what to give up during Lent."

"Well," remarked Miss Peppery, "you might give up your seat in a street car occasionally."—Philadelphia Press.

PUMP IRRIGATION

AN I.H.C. ENGINE
WILL GIVE YOU ALL
THE HEAD YOU CAN
TAKE CARE OF

IF you have to depend upon the pump for irrigating your land, you must have a powerful engine.

Formerly irrigation on a large scale by pumping was thought to be impracticable. But that was before the days of the I. H. C. engines.

In building engines for irrigation purposes it is necessary for the designers to take into account the fact that water must be raised in quantities, and that frequently it must be raised to a considerable height.

The use of hundreds of I. H. C. engines by practical irrigators is evidence of how well these requirements have been met, and how well the I. H. C. engines are adapted for this special work.

The engines are not only powerful, but they have the two other absolutely necessary requirements:

They do your pumping economically.

They run dependably with practically no attention.

Irrigators of large tracts of land must have an engine that is economical in fuel consumption. The I. H. C. engines have reduced fuel consumption to a very low minimum.

It isn't necessary to keep an extra man to attend to the engine. Only an occasional return to the engine is necessary, or a small boy can give it all the attention required.

If you have a lake or stream below your land, or ditch, just look into the matter and see how well an I. H. C. engine will solve your irrigating problem.

Vertical engines made in 2 and 3-Horse Power.

Horizontal (portable and stationary), in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

Live Stock and Dairy

BUTTER MAKING ON THE FARM.

A LEVER butter worker is not expensive and can readily be found at almost any store handling dairy supplies. When I began to make butter, no form of worker could be purchased in the then little village of Fresno. Indeed, the storekeepers rather resented my wanting such a thing! They told me: "Don't you know that butter cannot be made in Fresno? It is impossible! It was not even good enough to use for cooking! It was only axle grease!" Now, I have never found anything that had to be done, impossible. It can always be thought out, for there is always a way around to master everything. I came home and thought about it awhile. Then I took a hatchet and knocked out some boards and cleats from the large ash box that the grand piano wore when it traveled in the freight car from Philadelphia. A saw and a jack knife shaped the triangular form for the worker, a plow clevis held the lever made from a cleat. One end of this was whittled into a handle. Then a rim was tacked on the sides with wire finishing nails. Behold, it was a butter worker! Don't laugh, for it was a good one and was used until the family butter-making grew and merged into a regular creamery plant, with combined butter worker and churn and power.

Working.

Even a simple butter lever must be rightly used to make it a success. If the lever is dragged over the butter it will spoil the grain. Raise the lever and fold the butter down with the paddles, then start at one side and raise the lever clear of the butter each time. Press it down, moving it on toward the other side across the worker. Fold the butter again up into a roll and again go over it with the lever, fold in from side to side and press again. The color should be even and the water cease to drip out when it is finished.

Moulding.

Stand the butter in a cool place, closely covered for a couple of hours, to harden. Scald and cool the molds before using them. Pack the butter into the molds and trim them off evenly. Turn on to a sheet of parchment paper, fold the ends in neatly on the butter. It costs but a trifle to have your name and address as maker on the paper. It is good to do this. It gives you standing as a maker of good butter and a chance to have a sale for it to private families. A better reason is the self-respect founded on doing honest work. The world recognizes that it is the thrill of doing our best, not the value of the product, that makes life worth living.

Private Trade.

A few private customers can always be found for good butter. This is to be preferred to selling or trading it off at the local grocery. Butter is not improved in flavor by being stored close to kits of mackerel, kitchen soap, candles and coffee. In selling to private families, there are some stumps to run against. A knowledge is gained of the lack of housekeeping in some women that is surprising. The way the refrigerators are neglected! When sickness and death come one can only think how would the faithful minister

who prays so earnestly at the funeral feel if he knew that through your wicked mind at that most solemn moment, drifted the thought of the refrigerator full of broken scraps of spoiled food and that it had an active hand in this death. It does not do to consider that a responsibility lies close at hand. You, as a dairy woman, know that much of your honest perfect butter has been spoiled by an unwashed refrigerator. Dirt! Dirt! Horrible dirt! Faults.

Watch the strainer cloths; they soon become foul and sour. By having three or four and using them in turns, washing, scalding and hanging out to dry in the air, the extra one will make them last much longer and keep sweeter.

Where churning cannot be done more than once a week it is almost impossible to have perfect butter. The cream must be kept at 50 deg., and a handful of salt is put into the jar with the first cream it will keep from developing a rancid flavor. Fifty degrees is as cold as it is safe to keep ripening cream without it is kept genuine cold storage. A temperature of between 50 and 36 seems to be favorable to a bitter ferment or bacteria forming rapidly while the natural crease of the lactic acid bacteria retarded or entirely stopped. The cream grows bitter, then decomposes without souring or clabbering in the natural way. Any one that has smelled the decomposed mass of rotted sterilized milk only knows the awfulness of this smell.

Women.

I believe every woman should have a separator to lighten her work. A separator that runs only an hour a week is last that much longer and the repair is that much lighter. The mowing machine does not work half the time, yet no farmer ever cuts hay with a scythe to save the money that stands idle in a mower! The kitchen is a workshop where the most important work, that of building up the physical frame to stand strains, goes on from day to day. Every workshop should be fully equipped with proper tools. The lack of running water and a boiler to keep it hot is common in the country homes. Work is trained out into hours that could be quickly accomplished if the proper tools were at hand. This makes it hopeless drudgery.

Servants.

The woman that employs a cook knows she must have proper tools, that the kitchen must be as fully furnished in its way as the parlor. Is it not pitiful that the hireling is more considered than the mother? The mother is already doing double duty as cook and as a trainer of children. Love does not shirk! Love does not strike! It carries the burden to the end. The husband often forgets to forbear growling over his food and the wife has had all the burden to bear.

Result: Rebellion of some women against living on a farm has taken place. They realize the truth of the rhyme,

Man works from sun to sun,
Woman's work is never done.

These women insist on living in the village and this dislike of the farm

Members of the Kings County Poultry, Pigeon and Pet Stock Association are planning for a good show this season.

early impressed on the minds of the children. Making the mothers happy on the farm will help solve the question, "Why do the young people leave the farm?" Lack of time to enjoy the beauties of nature has much to do with it. The influence of every-day complaints of discomfort find echoes in the feeling of the growing children. The city life looks desirable because the work is finished some time before 6 o'clock and the rest of the time is their own. In the country the work begins early, finishes late, and there is no enjoyment to look forward to lighten the soil.—M. E. Sherman.

LET DAIRYMEN ORGANIZE.

If you will spare the space in your valuable paper, I would like to address the dairymen of California, on a very important subject. My opinion is that dairymen should organize a Dairyman's League. The design to be for their mutual protection. My reason for such organization is that I don't think that the dairyman gets a square deal. The experience of the Holtville Creamery Co. leads me to this belief.

The Holtville Creamery Co. has been making butter about five or six weeks. The first shipment we made, a telegram came stating "butter very poor, what shall we do with it?" But we did not think so much about it this time as our churn was new, and might have tasted of the churn. But twice more since the same word has come back. And the last time we had the butter inspected by several competent persons, and they all declared it first-class.

Now I think some one is working a scheme to put us out of business, and, no doubt, many other creameries are having the same experience.

My plan is this: Let all the creamery companies, or the dairymen in each settlement of the State, call a meeting and choose a delegate to represent them at a convention to be held in Los Angeles at such time as thought proper, and organize a dairyman's league. This organization should make provisions for cold storage in Los Angeles and San Francisco. This would enable us to keep our butter or cheese as long as we desire, or till the market suits us. The price of butter should be the same in San Francisco as in Los Angeles. Butter that was sold on the local market should be sold cheaper than butter that had to be shipped. And this would have a tendency to stimulate the home market.

It might also be necessary to provide a fund, so that if we had to hold our butter for a considerable length of time, no one would suffer. We could hold our dairy products till the price is right; in fact, we would set the prices ourselves. But, of course, the price would be regulated by the supply. I would be pleased to hear from anyone on the subject.—W. F. Gillett, Holtville, Imperial Co.

BARRENNESS IN COWS.

A reasonable healthy cow or heifer that has been bred once or twice at different periods of heat to a reasonably healthy bull, and fails to get with calf, should be looked upon as barren, unless it may be the fault of the bull, which is very seldom the case. This can be determined very easily by breeding the bull to several of the cows and watching the results. If

Wood Sole Shoes for Creamery Men, Farmers and Milkers. O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

any of them conceive, that proves that the bull is not at fault.

In case a cow does not conceive it is not advisable to take her to outside bulls, as by so doing chances are being taken of introducing into your herd diseases that may prove more serious than barrenness.

A cow coming in heat at unreasonable periods and frequent intervals such as the day following expulsion of the foetus, or the birth of a calf, is another sign of barrenness.

The mere fact of a cow coming in heat at any time after she is bred should be looked upon with suspicion, and should receive proper attention as early as possible, for the reason that the longer the cow remains barren the more difficult it will be to get her with calf.—By Dr. David Roberts, Wisconsin State Veterinarian.

STOCK TONIC NECESSARY.

Farmers and cattle raisers are coming more and more to see the great importance of a stock tonic.

Before our present-day experimenters proved their point, no one thought it necessary to do anything to aid animal digestion, in fact, no one thought such a thing could be done.

Now feeders of live stock, whether for beef or milk, never even attempt to "fit" a bunch of steers or produce a given quantity of milk without giving each animal in the herd a corrective in daily doses.

A few years ago farmers took sickness and loss as part of the business. Their profits were small because a few weeks heavy feeding on an unbalanced ration, without assisting nature in any way, was sure to throw the animal "off its feed" and actually undo all that had been gained up to that point.

The amount of money lost to feeders in this way must have been something startling, and under our present laws of keen competition would have been ruinous.

All this uncertain and haphazard way of doing has given place—thanks to the few who have made a study of these things—to a scientific and certain way of reaching uniform results in the cattle trade. Men know a whole lot more than they did, but it's the Stock Tonic above all else that has given cattle raising the reliability of an established business.

If the reader will think for a moment how much the animal system is like a machine, he will see a good reason for the tonic idea. If you overload a machine—ask it to do double work—more power is needed to run it and the strain on every part is greater. So with the fattening steer or milch cow—heavy feed means great strain on the digestive apparatus, more nerve force to run it and more wear and tear on it.

Here is where the tonic gets in its work. Composed as it is of elements known to be beneficial, it gives just the proportion of added strength needed for each part and so the whole animal is carried over and beyond the danger point and enabled to make steady gain in weight. A stock tonic is certainly the one thing needed by the feeder if he is after the greatest profit in his business.

Our fathers got along without the "food tonic" because they didn't know it. To the farmers and feeders of these days the "food tonic" of known value, containing the bitter principles which aid digestion, iron for blood building and cleansing nitrates in proper proportion, is an absolute necessity.

Several farmers' institutes held near Bakersfield were well attended, and much interest manifested.

See us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Clean Skimming Means Good Living

The hog trough is no place to put butter. Wide awake farmer want the cream separator that skims the cleanest. It means more profit—better living. That separator is the Sharples Dairy Tubular—no separator that's different. Sharples Dairy Tubulars have twice the skimming force of any other

separators—skim twice as clean. Prof. J. L. Thomas, instructor in dairying at the agricultural college of one of the greatest states in the Union, says: "I have just completed a test of your separator. The skimming is the closest I have ever seen—just a trace of fat. I believe the loss to be no greater than one thousandth of one per cent."

That is one reason why you should insist upon having the Tubular. Tubulars are different, in every way, from other separators, and every difference is to your advantage. Write for catalog \$.30 and valuable free book, "Business Dairying."

The Sharples Separator Co., West Chester, Pa. Toronto, Can. Chicago, Ill.

PEDIGREED NURSERY STOCK.

ORCHARDISTS and fruit growers generally have much to complain of in the carelessness with which even established nurserymen handle their stock. In buying a lot of trees of any one kind for an orchard, it is too often found when they come into bearing that other varieties have become mixed with them, and that very many of the trees are not true to name. It is exceedingly difficult when one has to depend upon a lot of unskilled labor for assistance to have all things properly done, but certainly there should be some means by which the planter can be safeguarded in his purchase. There is less care exercised in the production of fruit trees than in almost any other productive calling. In animal breeding all thoroughbred stock is registered and pedigreed. We know all about the sire and the dam and can figure on the chances of the offspring. This is true of poultry, and even of flowers, but in fruit propagation there is the greatest carelessness. The nurseryman too often arranges with an orchardist for a lot of scions and his employees are sent to make cuttings out of a certain block of trees. Little care is taken as to whether all are true to name, whether they are hardy growers and good bearers, whether they are clean or subject to disease, but so many thousand cuttings are wanted and they are slashed from the trees as it happens. Fruit trees should be bred as poultry and animals are. The nurseryman should have well known and pedigreed stock from which to secure his scions. Every tree should be studied and known and be marked for its qualities. It may be a good bearer, a sturdy grower, resistant to disease, or have other desirable qualities, and stock grafted from it could be sold with a guarantee for quality.

EXTERMINATING PESTS.

We often hear and read about insect pest extermination. And recently much has been said about exterminating the White Fly. It is a safe proposition that, once thoroughly established, no pest will ever be exterminated. It may be held in check, but never gotten entirely rid of. It is just possible that the White Fly, being within limited bounds, may be exterminated, although there are serious chances against it. All that can ever be hoped with regard to any of our pests is to keep them within limits—reduce their destructive force. This must be done by artificial measures until we can secure natural checks, but once the balance of nature is restored, then they can be left to themselves. While on this subject, much is being said of a parasite for the White Fly, and some people are willing to wait for it. That there is a natural check for this pest is unquestioned. We have a number of native pests belonging to the same family and these are kept down by their natural enemies; we have seen as many as 95 per cent of some of our native aleyrodes destroyed by an internal parasite, but we have none yet that prey upon the White Fly, which is a new species in our State. Now, we have not a parasite for this pest, we do not as yet know where it is or what it is; in the meantime every effort should be made to confine the pest to its present limited area, to

stamp it out there if possible, and take every means to prevent it from spreading to clean sections, and in the meantime, it would be well to find out the country of its origin, and discover, if possible, its natural check.

SPRAYING FOR PEACH BLIGHT.

The State University has issued a very opportune bulletin on the peach blight and remedies therefor. This is the work of Prof. Ralph E. Smith, who has had charge of the investigation of this disease for the past two years. This bulletin gives in detail the results of numerous experiments and confirms the discoveries which have been made in practice, that to be effective, the work of spraying for peach blight must be done before the middle of December. Work done after this date is less effective until by the middle of February it is valueless. The peach blight is a fungus disease, unlike the pear blight, and is easily controlled if properly handled. The one remedy is the Bordeaux mixture, sulphate of copper, lime and water. These ingredients differ in their proportion, according to the judgment of the user, but the common strength for winter use is sulphate of copper, 16 pounds; lime, 20 pounds and water 100 gallons. We have known cases where the water was allowed to absorb all the copper sulphate it would hold in solution, and no harm resulted. This, of course, is for winter use while the trees are dormant. When the trees are in foliage it would do serious damage if used of too great a strength. However, if effective work is to be done against peach blight the work should be done without delay, as every day that passes after the middle of December renders the labor less and less effective.

CONTRACTING FOR RAINFALL.

Farmers of the west side of the San Joaquin valley have entered into another contract with Hatfield, the "rain-maker," for their supply of winter's rainfall. This is clear "heads I win, tails you lose" proposition. If there is a certain amount of rainfall, the farmers contract to pay Hatfield a certain sum, but if the rain does not fall he gets nothing, nor do the farmers either. When we consider that the storms which bring to us our winter rains originate away off in the Pacific ocean, from whence they draw their supply of moisture, and that these storms are no insignificant phenomena, but often cover an area of thousands of square miles, the improbability of a man with a pocketfull of chemicals which he lets off influencing them, will be appreciated. All rains are caused by natural, and never by artificial, causes. But still, if nature provides the rain Hatfield will get the pay, and if nature goes back on him, why the farmer will have short crops and Hatfield will be no worse off.

NORTHERN CALIFORNIA NEEDS RAIN.

The season is now advancing and in the northern counties there has so far been very little rainfall, not enough to be of any service. By some reversion of the natural order of things the precipitation has been more frequent and more copious in the south than in the north this season. At the present time, while there is still time enough ahead, the northern farmers are looking ahead with some degree of anxiety.

Deciduous Fruit Culture

WALNUT TREES.

WHAT is the best kind of walnut trees? What age are trees the best? What time for planting? Do they need as much irrigating as orange trees? What are the diseases they are subject to? What are the methods of curing and shipping nuts? Would it be advisable to plant a strip of alfalfa between rows of walnut trees for a few years until trees get large?—C.

If by best kind is meant seedlings or grafted trees, there is quite a difference of opinion among growers. It is certain that if nuts are desired of uniform quality throughout the orchard it will be necessary to plant grafted trees. Even though you plant trees that have been grown from the nuts from any selected tree, the result will not be a uniform product. There is more or less variation in the product of all varieties of seedling fruits, possibly less with the walnut than most others. When I planted the 16-acre walnut orchard on the Barbour ranch four years ago it was decided to use seedlings. I knew a nurseryman at Rivera who had 4000 one-year-old seedlings that had been grown all from the seeds from two trees and each lot kept separate. The one tree from which the nuts were procured had not failed to produce a full crop of fine nuts for 15 consecutive years. The other tree had only borne four or five years, but nuts of exceptional quality. I secured the privilege of going into the nursery before any tree had been sold, and selecting and marking the number I wanted; 328, if I remember correctly. This was in November and they were allowed to remain until February 1st when they were dug with special care so that all the root was secured. They were handled with care, never allowing the roots to become dry, and planted at once. They have not all fruited yet, but those that have seem equally as good as the parent tree.

As to the age: If seedlings are planted, use one-year-old invariably. Be sure to get all the root—at least down to two and one-half feet, if they are so long as that. With grafted trees you will necessarily have to get an older root, as it cannot be grafted until one year old. The new Royal Hybrid walnut, a cross between the Eastern Black and the native California Black, by Luther Burbank is, perhaps, the best known stock to use for grafting upon.

Plant about February 1st. Generally speaking, the walnut will need about as much irrigating as the orange if you mean to have it do its best. And I might add, about as much fertilizing, too. This may not be so necessary at first, but when the trees become large and bear heavily they make an enormous draft upon the resources of the soil, and the wonder is that many orchards do not fail to produce nuts under the usual starvation method.

The worst disease affecting the walnut is blight, and we do not seem to have made much progress in combating it. Like all fungoid growths it is affected more or less by atmospheric conditions, so that some seasons it is worse than others.

The curing and shipping is so largely in the hands of the walnut

associations that it scarcely concerns the grower farther than to obey such instructions as they issue to the growers.

I strongly advise against growing alfalfa between the trees in a walnut or any other orchard. I have often seen it practiced, but the result is invariably either a poor orchard or a poor alfalfa crop. If it is desirable to use the ground between while the trees are young, plant crops that require cultivating and be sure to fertilize. If you do not, do not be surprised at a poor walnut yield later on.—Q. A. L.

CURING FIGS.

Figs that are dried for the market are allowed to ripen and hang on the trees till they fall to the ground. Before the figs begin to drop, all clods should be raked from under the trees or else the ground beneath the trees should be rolled so as to crush the clods or push them into the ground. In a commercial orchard, this is the only practical way except close to the trees. Here the clods should be raked out within reach of the clod crusher. Straw or chaff is a good material to spread under the trees when there are only a few in number, and we are of the opinion that it will pay when close to the vast grain-growing sections in the fig districts. This keeps the figs clean and also prevents any absorption of moisture from the soil.

Figs should never be gathered when there is dew on them. Allow them to dry off entirely before touching them. Place on trays till they are dry enough to be firm, when they can be placed in sweat boxes till they are to be packed. An ideal time for gathering figs is when the north wind is blowing.

At the time of packing the figs in boxes, the fruit should be dipped in hot water that is slightly salt. This kills the eggs of any insects that may be in them and insures against wormy fruit. The figs should be packed while still hot and nailed up at once.

SEEDLESS PEAR.

The seedless pear unlike the seedless apple is likely to be a go and a new variety has been accidentally discovered by A. I. Mason of Hood river, Oregon. All attempts so far to arrive at its origin have proved futile, but authorities on the subject say that if it continues to propagate seedless and colorless pears it will form the nucleus of one of the most valuable canning pears known. Being without core or seeds there will be no waste in putting it up, and its size and fine quality, combined with the lateness with which it comes into bearing, brings it in between the summer and late winter varieties. When ripe it is of finer quality than the Bartlett and a much better fruit for all around purposes. Several years ago Mr. Mason bought a large consignment of nursery stock from a dealer, whom he afterwards discovered had not sold him trees true to name and the seedless tree developed out of the lot. This year the tree yielded six boxes of fruit, in none of which could be found a seed or core or any indication of one except a slight mark around where the core usually is and which became visible only after the fruit had been cut in two for some time.—Field and Farm.

EFFECTS OF BLIGHT.

Continued from Cover Page

been under observation and experiment by the station to a considerable extent, culminating in the general campaign of control in the fall of 1906. The blight was extremely prevalent in the spring of 1906, and somewhat less so, but still very destructive indeed in 1907. The large acreage of peaches which received timely spraying previous to the latter season rendered the effects of the disease much less noticeable. In the unusually wet spring of 1905, it was noticed generally in the Sacramento, San Joaquin and other valleys that peach trees were affected to an alarming extent with some unusual condition. The trouble consisted in the dying of the buds on the fruiting wood, spotting of the green twigs, and dropping or non-development of the young leaves and fruit. Particularly noticeable, and the most prominent feature of the disease, was a copious "gumming," or exudation of masses of gelatinous sap from the twigs, originating in the dead spots and buds. This gumming was extremely abundant in wet weather all over the one-year-old fruiting twigs of affected trees, and with the blighted leaves and fruit and spotted, leafless, dead or dying twigs and shoots, gave the tree a most distressing and alarming appearance. The crop was entirely ruined in badly affected orchards and the trees brought into an extremely weakened condition.

This describes, in a general way, the nature of this disease. It is readily distinguished from any other peach trouble by the features mentioned. It is essentially a winter or early spring disease of the fruiting twigs, the one-year-old wood which is the valuable part of the tree. This growth becomes killed all through the tree, except in the very top, and very serious loss and injury result. Most of the infection takes place in the winter, before the new growth starts, on twigs which were healthy and free from the trouble at the end of the growing season the previous fall. The new fruit becomes affected to some extent, but the principal damage is done by the killing of the buds and whole twigs at a period previous to the development of fruit.

During 1905 and 1906 the disease occurred in greater abundance, appearing in all the peach growing sections. Santa Clara county and the Southern California peach sections were the last affected, but the blight now occurs in both regions. The losses occasioned by the "blight" have been enormous, particularly in the seasons above mentioned when climatic conditions were particularly favorable and little was done to check the disease. Indeed, it may truthfully be said that in the summer of 1906, after two years of active prevalence of the "blight," the peach orchards of the Sacramento and San Joaquin valleys, the main commercial acreage of the State, would have been in an absolutely ruined and unproductive condition without some means of checking the disease. The trouble was abundant in every orchard, all varieties were more or less affected, and the younger growth, which in the peach bears the fruit, had been almost completely killed and further development prevented. With the disease unchecked peach growing was apparently at an end.

As to control and treatment of the blight, see leading article on page 491, this issue.

The Ornamental Garden

PANSIES AND CARNATIONS.

IT IS NOT too late to plant pansy
seed and have them blooming
throughout the spring and early
summer. Many of the florists grow
pansy plants for sale, and where they
can be purchased and set out at once
you will get flowers sooner than by
sowing the seed now, but they will
cease to bloom sooner than plants ob-
tained from seed sown at this date.

Many failures occur in efforts to
grow pansies and other flowers from
seed for want of suitable soil. It is
much more difficult to get suitable
soil in an arid climate than in a
humid one. Soil for tender seedlings
wants to be full of humus, so that it
is light and will not "bake" or pack
down almost like cement when water-
ered. The amateur, if experienced,
will follow the practice of the profes-
sional florist in California in the mat-
ter of securing suitable soil for such
work, by looking months and even
years ahead. The soil in which I
now have pansies growing, I prepared
some two years ago, when I got ma-
nure from the dairy corral and run
it through a wire screen and added
about one-fourth common garden soil.
This was thoroughly mixed and occa-
sionally turned over until it was
rotted sufficiently for use. I invari-
ably sow pansy seed in boxes in rows
across the box about two inches
apart. These boxes or flats are usu-
ally three or four inches deep and
about 15x20 inches in size.

At this season the boxes can be put
in the full light, but should be placed
where they will not be exposed to
sweeping draughts of air, as such a
situation would cause the soil to dry
out quickly. Be careful that the soil
does not dry out and, on the other
hand, do not keep it constantly
soaked. After the seedlings are up
and show the third leaf, transplant
into other similar boxes of good soil,
putting them about two inches apart
each way. When they have grown so
that the foliage about covers the soil,
transplant them into the bed where
they are to bloom—setting them
about twelve inches apart each way.
In preparing this bed, work into it
some old well rotted manure, if it is
possible to get it.

After the plants have grown so that
they are say, four inches across,
mulch the entire surface between the
plants with manure from the dairy
corral. This manure should be
screened so that all lumps and coarse
material can be rejected. It can be
put on at least two inches deep with-
out injury. This mulching serves a
double purpose—shades the soil and
provides food for the plants.

Do not fail to give the pansy bed
sufficient water to keep it growing
freely. When the plants grow so
that they cover the entire surface, the
evaporation is very great from such
abundant foliage and no mere sprink-
ling once a day will do. You can
greatly prolong the life of the bed by
picking off the fading blooms and
thus prevent the plant from produc-
ing seed.

A great difference of opinion exists
as to whether pansies should be
planted in the shade or open sunlight.
I plant in the open sunlight, and
have perfect success up to July first.
After that date it is more or less dif-
ficult to grow pansies in any situa-
tion, except very near the coast.

I should like to speak a good word

for the tool known as a bricklayer's
pointing trowel. I have never found
its equal in transplanting almost any
plant used in ordinary gardening
operations. I have repeatedly set
3000 strawberry plants or 6000 onions
in a day of nine hours with the
trowel—something I could not have
equaled with any other tool I ever
tried—and I have tried about all of
them. They can be bought in three
sizes and cost from 40 to 60 cents
each.

Carnations.

Many persons have a few carnation
plants and would like to increase
their number. This is usually very
easy to do by using the right kind of
cuttings. Take such branches as are
vigorous and thrifty, from four to
eight inches long and that have not
developed a bud. Plant in any good
place in the open ground, being care-
ful to firm the soil well around the
base of the cutting when it is planted.
It is a good plan to mulch the soil
about the cuttings with leaves or old
straw, so that the ground will keep
cool and moist. This method can be
used from November to March. Take
cuttings from only healthy, vigorous
plants. Set them four to six inches
deep, depending on the length of the
cutting.—Q. A. L.

Six nations believe that the sun-
flower turns toward the sun and so
thoroughly are they deluded that
they call it by a name which bears
witness to their error. Thus the
French call the sunflower tournesol.
The Spanish call it girasol. The
Hungarians call it naptaforgo. Each
of these words means turn to the
sun. The English and Americans do
not go quite so far in admitting
themselves to be the plant's dupes.
They only call it sunflower. They
mean by that name, though, quite as
much as the other names imply.

A collection of primroses makes a
glorious display and may be obtained
at the cost of a few cents. The
seeds in mixture or separate colors
cost only five or ten cents a packet.
If sown in a box and well cared for
ten packets will yield plants for sev-
eral windows and some to give away.
Those desiring blooming plants for
their windows next winter should
buy a collection of primrose seeds
this spring and raise the plants. By
studying the young plants as they
grow and learning of their require-
ments a fine display of bloom will be
insured.

Mrs. Nayberleigh—Why, what are
you crying about?

Mrs. Youngbride—Well, you know,
John is away on a business trip—

Mrs. Nayberleigh—Yes.

Mrs. Youngbride—He writes that
he gets out my picture and k-kisses
it every day.

Mrs. Nayberleigh—Well, that's
surely nothing to cry about.

Mrs. Youngbride—Yes, it is! Just
to play a joke on him, I took my
picture out of his grip when he
started, and put one of my
m-m-mother's in its place.—Cleve-
land Leader.

The Vegetable Garden

THE MAGIC VINE.

A fairy seed I planted
So dry and white and old;
There sprang a vine enchanted
With magic flowers of gold.

I watched it, I tended it,
And truly, by and by
It bore a Jack o'lantern
And a great Thanksgiving pie.

ROSELLE MILDEW.

ROSELLE or Jamaica Sorrel (Hibiscus Sabdariffa) was attacked last year by mildew. It was about the first of November. Those who have planted roselle this year should keep on the lookout for it. The mildew is characterized as follows: The leaves, petioles, stems and sometimes the entire plant assume a white powdery appearance as if they had been lightly dusted over with flour or lime. The appearance comes on quite suddenly. It usually follows the cool, moist nights that occur about this time of the year. The vitality of the plant is probably weakened by the drop in the temperature, and this renders it more susceptible to the attack of the mildew. Leaves attacked by the mildew soon begin to look unhealthy, and turn slightly yellow.

The disease is caused by a white mould-like fungus, known scientifically as a species of Microsphaera. By means of a hand lens one can observe the network of very minute white mycelial threads on which there are borne upright chains of small spherical spores. These spores may be carried by the wind or insects from one plant to another, and in this way spread the disease rapidly to great distances in a short time. In the course of several weeks, if the fungus is not killed, the powdery appearance disappears, and on the threads are seen minute black specks. These contain the spores that are able, like seeds, to live through the winter months and reproduce the mildew the following year.

The treatment recommended for this disease is to spray the plants as soon as the white appearance is noticed with potassium sulphide (liver of sulphur,) using one ounce to two gallons of water. Dissolve the potassium sulphide in water just before using, and in case any of the solution is to be kept for later spraying, put it in a tightly corked glass bottle. As an additional preventive for the following year, all dead plants should be burned up after the fruit is picked, in order to kill the resistant spores that would otherwise live over winter on the dead leaves and stems and infest the next year's crop.—Florida Agriculturist.

THE TOMATO WORM.

This sometimes troublesome insect is the larval form of one of the sphinx moths. The caterpillar is distinguished by the presence of a peculiar horn on the tail, which is commonly supposed to be venomous. As a matter of fact, it is absolutely without poison of any kind, and the worm may be handled with impunity by any one. The insect passes the winter in the resting or pupal stage in the ground, and many of them will be destroyed by thorough cultivation. In small gardens where the worms are doing any considerable damage they may best be removed by hand picking. Large fields that are badly

affected should be sprayed with Paris green early in the season before the fruit attains any size. This will probably remove most of the brood and make the matter of hand picking the few that remain a comparatively easy task. Often this insect is attacked by a parasite fly that lays its eggs on the body of the worm and eventually causes its death. The small cocoons of the fly are sometimes to be found sticking all over the bodies of the caterpillars. Such specimens should be allowed to develop, as they are doomed to an early death, and by allowing the flies to reach maturity they will in time get the best of the worm.

GARDEN NOTES.

Why not repair the garden fence now? Plow in lots of barn manure now.

Put the garden seed you gather where rats, mice or other enemies can't destroy.

Have enough seed on hand so that when you are ready to plant you will have enough to plant two or three times, in case you fail the first or second time.

Celery is very greatly improved in quality when conditions are made favorable for rapid and continuous growth, and also largely increased in yield. As high as 400 pounds of nitrate of soda have proved most profitable.

Pile and burn all the trash in the garden. In this way you will destroy insects and their eggs.

Clean off the asparagus beds and give a coating of manure.

Get after the borers in apple, peach and plum trees. Try a wire first. If not successful use knife.

Cold storage demands fruit that is picked, packed and shipped with great care. Pruning, thinning and spraying are essential processes.

When the work of harvesting fruit is completed, gather up all rubbish and burn.

Better find out if your young orchard needs under-drainage. It is not too late to put in a system of tile drains four feet deep.

Chinese bottle gourd are both useful and ornamental. They raise their own covers to a wide necked bottle so you can put the "lid" on when it suits you.

The quickest way to get a taste of onions in early spring from your own garden is to plant winter onions now. Get Egyptian onion sets and you will have something to stir your blood next March when country people feel as if they ought to "take something."

Ten years ago there were only seven hundred cars of cantaloupes handled by the railroads in the United States. Last year the shipments of this fruit reached nearly ten thousand cars.

Notwithstanding the large production of edible nuts in this country, the importations are steadily on the increase. It seems that it will be a difficult matter to overstock the market, especially so as the demand for nut products is steadily increasing.

The sixth annual convention of the National Nut Growers' Association was held at the Jamestown Exposition, September 26-28. It was attended by interested parties from eighteen States, which shows that the industry is gaining rapidly in all parts of the country.

Transplanted in flats of 100 each. We prefer orders of 1000 rather than 10,000; outside limit 20,000. Our trees are up to our usual standard. We invite correspondence. Our booklet, telling when, how and what to plant, free to our patrons only. Address

W. A. T. Stratton, Nurseryman, Petaluma, California

PESKY THIEVES.

And now it seems that W. M. Bristol is to be again arrested and tried for the heinous crime of protecting his crops against the depredations of quail by trapping the pesky little thieves. If a man cannot protect his ripening crops, raised at the expense of much toil and perspiration, against predatory animals and birds, simply because the wealthy and leisure class desire "sport" in shooting them, meanwhile trampling down those same crops with their "English shooting boots," then, indeed, it is time for the common people to rise up in their wrath and relegate legislators who make such fool laws to the way back seat and set them down so hard that it will rattle their loose bones out of place. We have suffered from predatory and pesky quail ourself and know how to feel for the other fellow.—Redlands Citigraph.

THANKSGIVING AS WE KNOW IT.

We have departed from the original idea of Thanksgiving Day as observed by our forefathers, quite as widely as from any single idea involved in their primitive teachings. Their idea of Thanksgiving was that of self-denial, fasting and prayer. They were beset by threatening foes, by hardships of every nature conceivable, and their only resource seemed to be to turn to the giver of all good gifts, in appeal for protection against the dangers which confronted them.

The painted savage of the forest lurked threateningly in their wake, distance from house and kindred rendered unspeakable loneliness to their situation, hunger often assailed them as they attempted to wring from a rocky soil the necessities of life. Prayer was their daily consolation for that safe deliverance which of themselves they could not procure.

As the years rolled on the primitive puritan changed into the progressive and plentifully supplied New Englander. Abundant crops garnered into bursting barns gave sufficiency everywhere. The Indian no longer roamed the forests the foe of the white man. The forests disappeared, and with this changed condition came the celebration of generosity, of plenty and thanksgiving to God for the mercies and benedictions which His love had bestowed. From abstinence and prayer came eating and drinking, and a festal day of family reunion.

And so, today, we commemorate with joyousness, around the festal board, the blessings of the year gone by. We are devoid of fear, and we look calmly and with assurance into the future, with a well developed idea that no danger is likely to

confront us nor an enemy destroy us. While this is true in the abstract it is a matter of deep concern to those more thoughtfully inclined, if indeed we are not going at too rapid a pace as a people. Are we not drifting too far from the landmarks of the fathers? Are we not inclined to forget in our wondrous prosperity, to whom we are indebted for our blessings? So surely as we do, we shall be called to account. Disaster will overtake us and we shall reap the whirlwind if we sow to the wind.

Back of all our splendid growth, our development and our luxury is the same power which befriended our forefathers. To this supreme power must we still account. May we not well remember our blessings, our mercies and to whom we owe our greatness as a Nation?

May we not reflect, amid the joyousness of Thanksgiving Day, that we still must hold this guiding force near to us if we are to go on in the course mapped out for us? Assuredly we ought, for certainly we need whatever guiding power there may be to help us, to keep us, to steady us in our onward sweep of destiny.

NO CAUSE FOR PANIC.

"What is most needed just now is that our citizens should realize how fundamentally sound business conditions in this country are, and how absurd it is to permit themselves to get into a panic and create a stringency by hoarding their savings instead of trusting perfectly sound banks. There is no particle of risk involved in letting business take its natural course, and the people can help themselves and the country most by putting back into active circulation the money they are hoarding.

"The banks and trust companies are solvent. There is more currency in the country today than there was a month ago, when the supply was ample. Since then \$55,000,000 in gold has been imported, and the government has deposited already \$60,000,000. These are facts, and I appeal to the public to co-operate with us in restoring normal business conditions.

"The government will see that the people do not suffer if only the people themselves will act in a normal way. Crops are good and business conditions are sound, and they should put the money we have into circulation at once to meet the needs of our abounding prosperity."—Theodore Roosevelt.

The above is a portion of the letter written by the President Nov. 17th to Secretary Cortelyou, approving his plan of issuing \$50,000,000 of Panama bonds and \$100,000,000 interest government notes, to be available immediately in the South and West as additional currency to help in the movement of crops. This is the most important measure of relief adopted since the money stringency occurred. It will, with the president's letter, do more to re-establish confidence in business than anything which has been done to that end.

JUST THE TIME TO ADVERTISE.

One of the most successful managers of a great commercial property in California, remarked to us recently that he always advertised most largely during times of business depression. Said he: "When people are not so crowded with work they take time to read what the commercial houses in their locality have to say about their business. I often get pointers which are valuable to me, and see things advertised which I want later; I know just where to go for them when I am ready to use them."

Another advertiser said: "When times are dull advertise extensively. There is plenty of money in the country and people will buy what they want when they think there is a bargain for them."

A. T. Stewart used to say that dull times made a later harvest for the enterprising merchant who had nerve enough to display his goods in type, when things in general were going slow. When business is rushing people do not read as extensively as when they have greater leisure.

The man who advertises is the man who wins—in the long run.

It is to be hoped the Secretary of the Treasury will bring those New York banks to time by withdrawing government deposits, unless they immediately pay the Western banks the balances due them. It is this monstrous action of those banks which has tied up the circulating medium of the West and crippled every industry.

Shop Talk

A CHRISTMAS SUGGESTION.—To our many readers who appreciate the Cultivator and its efforts along the various interests of California agriculturally—what more appropriate Christmas remembrance to your relatives or friends, than your year's subscription to our paper.

For a son, daughter, brother or friend starting in on the ranch, you know the Cultivator would prove an invaluable teacher. No matter whether in this State or "back East," they are interested in California methods and crops, and, perhaps, thinking of coming to this Coast.

NOTE.—We are going to make this suggestion to your advantage to you as well as everybody else by crediting your subscription account three months for each new name that you send. So you see you are killing two birds with one stone by making a very acceptable present and getting your own paper at a reduction of 25 per cent.

Also, to save you any bother in the matter, we will mail to each person to whom you desire the paper sent, so as to reach them at Christmas, a card giving your name as donor, and length of the subscription.

Just fill out the blank found on another page marked "Christmas Order;" cut it out and mail it to us with P. O. money order, and we will do the rest. Understand that the new subscription will be stopped at expiration.

A SENSIBLE MOVE.

Bill board advertising is receiving severe criticism at the hands of civic societies in this State and throughout the country at large.

The ugliness of the bill board appeals to the mind of every man and woman who desires to see a clean country, or a neat town. You can have neither so long as the unsightly billboard is in repulsive evidence wherever you look.

We note with satisfaction the effort of civic clubs to do away with the offensive bill board, and especially such action as was taken by three hundred merchants of Cincinnati who have made an agreement that they will do no more billboard advertising, and will utilize nothing but newspaper space for that line of advertising.

From a business point of view, billboard advertising is an almost worthless proposition, and the action of these Cincinnati merchants simply reflects the growing conviction in the mercantile world that advertising is an art—or a science—which ever term is most acceptable, and that the indiscriminate plastering of advertising matter over billboard acreage, either with a paint brush or coarsely printed blanket sheets, is neither artistic or scientific, and the tendency of which is to repulse rather than attract.

Commenting on this phase of the subject, the Des Moines, (Ia.,) Capitol says:

"The place where the advertisement is given that serious consideration which is of value to the advertiser is at the home fireside. It is there that the wants of the family are suggested. It is there that the needs of individual members are discussed. To the newspaper they turn for information as to where to go. The farsighted merchant understands the situation and spends his advertising money with the newspapers which will reach the people, rather than with the billboards whose only function is understood to be that of a background for the portrait of some theatrical celebrity who prefers the paint-brush method of attracting public attention."

The Cincinnati merchants have tried various ways of advertising, but they unanimously agree that the newspaper is the medium which outshines them all.

A DEEP LAID PLOT.

The opinion is becoming general throughout the country that the present financial flurry is chargeable directly to J. P. Morgan, John D. Rockefeller and one or two presidents of the great railroad lines of the country, whose purpose has been to discredit Mr. Roosevelt and to be avenged for their prosecution by the government for violation of law.

If this idea shall become fixed in the mind of the public, nothing in the world will prevent the re-nomination and overwhelming election of Theodore Roosevelt as the next president of the United States. The country is behind the president, irrespective of politics, in his determination to enforce the laws of the land.

Agricultural Notes of the Pacific Coast

Northern California

Colusa has a successful horseradish grower.

Pheasants are being introduced in the hills near Tehama.

The recent farmers' institute at Napa was very successful.

Many homeseekers are locating on farm lands near Willows.

A large meeting of forest rangers was held at Yreka last week.

Laterals are being dug in a large irrigation system near Colusa.

One farmer near Coos river has installed three milking machines.

Big ranches about Stockton are being subdivided into town lots.

Siskyou county is shipping a large number of live stock every day.

Sacramento Driving Club is to hold a horse show on Thanksgiving Day.

Spraying to prevent peach blight is common all over the Sacramento valley.

Yuba county produced \$500,000 worth of vegetables and fruit last year.

For the first time in twenty years, Petaluma will have a poultry show this fall.

One ranch will put in over a thousand acres of alfalfa near Willows this season.

Rye grass is proving to be extremely satisfactory pasturage grass in Butte county.

Six hundred dollars per acre has been made from an acre of potatoes near Placerville.

Some magnificent barley has been produced on overflowed river bottoms near Woodland.

Stockton canneries are contracting with growers for a larger quantity of tomatoes next year than heretofore.

A forest ranger near Weaverville has been arrested for removing earmarks from cattle and substituting his own.

Santa Rosa turkey breeders are receiving eighteen cents for live turkeys. It is said to be a great turkey shipping point.

The vineyards at Chico are being cleared of their leaves and late fruit by the Stanford sheep which are being pastured in them.

Petaluma claims to have a million and a half of White Leghorns to choose her winners from for the coming poultry show.

The common "resin weed" (*Grindelia robusta*) is being shipped in large quantities from Colusa to Detroit and New York druggists.

Oroville is not entirely given over to the production of oranges, as is proved by the fact that her county produced \$526,000 worth of poultry and eggs.

The Santa Rosa members of the Sonoma County Co-operative Poultrymen's Association have elected F. W. Wilson president and C. A. Williams secretary.

Grapes that were to be shipped to New York from Yolo county have been diverted to the northwest and other nearby points, because of injury from the recent rains.

Central California

Shippers at Sacramento are combining to fight freight rebates.

Turlock cannery is putting up hundreds of tons of canned pumpkin.

The Malaga packing house has one hundred hands employed packing raisins.

One Tulare county planter will plant four hundred acres of oranges this season.

A two hundred-acre field is soon to be planted to onions for seed growing at Gilroy.

The Santa Clara county Pomona Grange held an interesting session on November 9th, at San Jose.

While Lindsay will make a good display of her own citrus fruits she will not compete in the coming citrus fair.

The Pajaro Orchardist Association met recently and received report from Chairman Judd of the fair committee.

The Pajaronian maintains that the State Farm at Davis is not being put into working shape as rapidly as it should be.

The apple growers of Gilroy recently held an interesting meeting addressed by Mr. Vlock, entomologist of Santa Cruz.

The Hanford Sentinel says that the Selma Irrigation District, which was organized under the Wright law, is to close up its business.

Total shipments of citrus fruits from Lindsay were seven hundred and fifty-five cars last year, and to date this season ninety-eight cars.

An advertisement in Lindsay Gazette asks for orange pickers at three quarters of a cent a box with a 40-cent daily premium for good workers.

The directors of the Lucerne creamery at Hanford for the coming year are: J. H. Dawson, G. A. Dodge, L. F. Burr, John Nesbit and M. J. Caetano.

Corn growers on the Merced river bottoms are getting eight cents per pound for corn husks. It will be used, it is claimed, for adulterating cheap tobacco.

The winerymen and others purchasing fruit near Fresno have been paying for fruit with notes bearing six per cent interest payable on cashing of bills of lading in the East.

The Lucerne Cream and Butter Company at Hanford marketed last year nearly a million pounds of butter of the value of \$306,662. The average price received was 29.46 cents.

A pastor in Bakersfield suggests that Kern county people after giving thanks as usual on Thanksgiving they should return thanks to Mr. Tevis for his service to that county in cutting up the large Big Field ranch.

Report from Lindsay shows the citrus fair is going to attract more attention than ever before, and preparations are nearly completed for its opening which is to be on December third. Its premium list shows that a large list of awards will be made in addition to those for citrus fruits.

Southern California

Hemet is soon to be incorporated.

Santa Ana poultry show opens next week.

The spud crop at Hemet looks very promising.

The celery market is reported not so good as last year.

The first shipment of oranges from Redlands was on November 15th.

San Bernardino county's oranges last year made a gross return of over \$7,000,000.

Wagner, the Pasadena rhubarb man, is to start a rhubarb nursery at Coachella.

Ventura Free Press estimates the output of lima beans at forty-nine million pounds.

Orchardists of Orange are to form a protective association to prevent fruit stealing.

Orange county is to have another celery-growing district at Aliso south of Tustin.

Bean ranchers of Oorange county are pushing their product to market as fast as possible.

The water in Lake Hemet registered 109 feet 8 inches Nov. 15, at the close of the irrigating season.

The Orange County Preserving Company has an output this year of thirty thousand cases of tomatoes.

The threshing machines of Ventura county are working day and night on the remainder of the bean crop.

C. E. Utt, the king of peanut shippers at Tustin, suffered a serious loss from the burning of his dryer last week.

Valley Center, San Diego county, claims ability to produce just as good apples as some of the higher mountain sections.

Ventura produces one million pounds of rhubarb annually, and her total agricultural output aggregates \$8,500,000.

Imperial county stockmen are organizing to secure the enactment of county laws for the protection of their industry.

The little town of Orange expressed twelve hundred and fifteen sacks of peas and beans to the local Los Angeles market last week.

The California Development Company and the Southern Pacific gang on the Colorado river levee has been somewhat reduced, owing to the money stringency.

The damage to the bean crop by the recent rains is found to be much lighter than anticipated. Not over two per cent of the crop will be injured, is the estimate of some.

We recently noted in these columns the record breaking load of walnuts at Saticoy which commanded \$1300. This is put in the shade by a Ventura rancher, James Evans, who delivered a ten-horse load of walnuts which weighed ten tons for which he received \$2760 check.

The officers and directors of the Redlands Mutual Orange Company for this year are: Geo. R. Stone, vice-president; A. B. Cowgill, secretary; Charles F. Woehr, Burgis W. Smith, R. B. Lane, A. K. Smiley, Dr. C. S. Lombard.

The Coast

The fourth crop of alfalfa is being cut at Crocker, Washington.

Walla Walla, Washington, is proving to be a great potato shipping point.

The hay crop near North Yakima has not been damaged by the recent storm.

A large cannery at Walla Walla, Washington, is putting in full time on canning apples.

Farmers about Grangeville, Idaho, will make about \$1,000,000 on their live stock this year.

One carload of clover seed shipped from Albany, Oregon, netted the snug sum of \$12,000.

Spokane cannery has already shipped forty carloads of canned fruit to Eastern markets.

A fruit grower at Wematchee, Washington, took \$1000 worth of apples from forty-eight trees.

Gov. Chamberlain, of Oregon, has appointed Robt. O. Stevenson forestry warden for that State.

The breaking of a large dam above Wallace, Idaho, caused the flooding of vast acreage of hay fields.

The price of butter in Portland has been held at 35 cents, which is held to be too high and will soon drop.

Between sixty and seventy thousand tons of hay are shipped from Ellensburg, Washington, this year.

W. K. Newell, president of the Oregon State of Horticulture Society, figures that the State will receive about \$4,500,000 for fruit this year.

Idaho State has selected eighteen thousand acres in one county which it leases at ten cents per acre for dry farming purposes.

Co-operative Creamery at Rifle, Colorado, will soon pass into private ownership, the co-operation not having proved successful.

State sheep inspector of Oregon is enforcing the law which prohibits sheep from entering the State from Washington without permit.

Apple shipments from Pullman, Washington, are being restricted by car shortage. One firm has thirty carloads ready for loading, and some of the largest graneries are filled to the

The Oregon prune market has been seriously affected by the money stringency, and some packers have notified growers to whom they have contracted fruit, that they will be unable to complete the contract.

The Portland Oregonian estimates the hops on the coast as follows: Oregon, 100,000 bales; California, 50,000; Washington, 17,500. Besides this, 50,000 bales of last year's crop are held over in dealers' hands. roof with apples ready packed.

The Lane County Fruit and Vegetable Growers' Association with headquarters at Eugene, Oregon, proposes to raise the standard of the fruit shipped from that section and make the reputation as shippers of fine fruits.

The great inland empire of Eastern Washington will have an output of \$128,000,000 worth of agricultural outputs. Of this the wheat crop alone will amount to, \$32,500,000, and dairy products \$5,000,000. Apples and other fruits \$14,000,000.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

A THANKSGIVING OFFERING

"Come, hear the tale I would unfold," said the gobbler to his flock,
"For what the stars this day have told has given me a shock.

"The zodiac, in days of old, with twelve signs are complete,
But woe is me, this day I see, thirteen are on the sheet!

"The last, a man with ax in hand, and blood within his eye,
Determination on his face, and teeth for turkey pie.

"I hied me to the Oracle to see what did portend,
And this is what he calmly said, 'I see your blooming end.'

"This man will grab you by the feet, with ne'er a chance to peck,
And though the ax is in his hand, you'll get it in the neck.

"Don't think that to your memory he'll offer up a toast;
But on the other hand, I see you'll get a frightful roast.

"And when you're roasted to a turn, the tale is not half told;
For while he likes you served up hot, you are not bad sliced cold.

"You think your finish then you've seen—it were a view quite rash;
This ruthless man with heart of stone will chop you into hash.

"E'en then he will not stay his hand—he'll make another swoop.
And at the end you'll surely find you've landed in the soup."

The Gobbler paused and wiped his eye, and then he simply said:
"My friends, if all of this is true, there's lively times ahead!"

R. L. COURTNEY.

AN OLD TIME THANKSGIVING.

MANY think that Thanksgiving was inaugurated simply to depopulate the country of the "American bird"—the turkey. In fact, Thanksgiving and turkey are synonymous with many. The use of the turkey for the Thanksgiving dinner has become so general in all walks of life that it is often a problem not only in the large cities, but even in the country, to provide a sufficient number to supply the demand.

It is no wonder our hearts turn to olden times when we hear our parents and grandparents tell of their childhood days when the Thanksgiving gaities lasted for several days. And how on Thanksgiving Day the whole family, comprising often three and four generations, would gather for a day or more of general Thanksgiving gaities. With a good supply of nuts, fruits, apples and elder, they would gather around the old-fashioned fireplace with its huge back-log, and listen to the older members tell how in pioneer days they would hunt the turkey which was to grace the table on this memorable day.

I remember on these occasions how attentive we always were when grandfather would tell us of one of his wild-turkey hunts, back in Eastern Kentucky and Virginia—and how, as the country became more thickly populated, the turkeys became scarcer and scarcer. They either moved westward down the Ohio River, or east to the Allegheny mountains. When grandfather was a boy, all that was necessary

when a turkey was wanted was to take the old flint-lock rifle and go early, yes, before it was fairly light, to some familiar feeding ground of the birds and there wait in hiding until about, or a little after, "sun up" for the flock to make its appearance. I remember how excited we would get when he would tell of the first call of the "gobbler," perhaps a mile or more away, and as the flock would approach and the calls would grow more distinct, and how the trained ear of the hunter would gauge the distance. How, often before they came in sight, the calling would cease, caused perhaps, by the barking of some squirrel or the falling of a nut which was loosened by the frost of the previous night.

Often when he was beginning to get discouraged, he would again hear the distant call. It would grow louder and more distinct until at last just as the first rays of the morning sun struck some unprotected spot the flock, always headed by an old "gobbler" would come into sight. What a grand picture that would make. The glistening white frost on the fallen leaves of many variations in colors; the strutting Tom with his bronze color, proudly leading his flock, yet always alert and looking for some hidden danger.

How grandfather would sit in a cramped position, his feet and fingers stinging from the biting frost, yet not daring to move, for a sound even of a broken twig would send the whole flock scurrying away. How he would longingly look at his priming and the old flint to see if all was ready for the fatal moment he would relate in a way to make us tingle. All was ready. Yet they were not close enough to risk a shot. How his heart would thump until he was sure it could be heard a mile. Yet the flock was steadily advancing. Then he would raise the long rifle and the trained eye would look down the barrel, only to lower it again. Never shoot till you can see the bird's eye.

Again he sights the trusty old gun that has never failed him. Bang! Before the smoke clears away he springs from his hiding and starts at best speed for the ravine which runs up the side of the low mountain. Up this ravine the flock speeds as fast as legs and wings can carry it. Upon this mad race, for two miles up the side of the mountain, much depends. Over boulder, around a tree, here jumping a ditch, never stopping a moment for breath, loading as he ran, until the summit is reached, only to see the last of the flock plunge into the heavy timber and out of sight down the side of the mountain.

Now he returns down the trail. He takes more time, as all chance for another shot this morning is gone. He retraces his steps to the scene of the hiding and gets his turkey. In those days such a thing as a clear miss was unheard of.

How the folks from the little house in the clearing anxiously watched for his return. For, oh, so much depends on that early morning journey!

Lost Feathers

Feathers on the ground and dropping from sleepy, droopy, half-sick hens—that's moulting time, when egg production usually ceases.

Mr. Poultryman, it's now up to you to restore the weakened hens to normal vigor and put them in proper trim for a large egg yield through the coming winter. Give them each morning

DR. HESS Poultry PAN-A-GE-A

in the warm mess. It vitalizes and "tones" the drooping bodies, aids digestion and carries off the clogging poisons that weaken and debilitate the hen. Thus it shortens the moulting season and hastens the return of productiveness. Poultry Pan-a-ge-a is the prescription of Dr. Hess (M. D., D.V.S.). It makes hens lay, market fowls fat, chicks grow fast and also wards off all poultry diseases. Endorsed by leading poultrymen and sold on a written guarantee.

Costs a penny a day for 80 fowls.
1 1/2 lbs. 35c. 5 lbs. 85c.
12 lbs. \$1.75. 25 lb. pail \$3.50

Send 3c. for Dr. Hess 48-page Poultry Book, free.

When writing advertisers, mention Cultivator

How different today, for those of us who raise our turkeys only have to dress our birds. Those who are less fortunate and have not the room or inclination to raise a Thanksgiving turkey, simply step to the phone and, calling up the butcher, orders a nice fat turkey sent over for Thanksgiving dinner.

As the world grows older neighborhood friendship grows less, and places us further from each other in this pleasant Thanksgiving intercourse. Well may the stories told to us by our fathers and grandfathers, of the "back East" Thanksgiving, be taken to heart by all of us, and applied at this season, especially in improving friendships and binding more securely the interests of the neighborhood, for we all have much to be thankful for.—Frank H. Thomas.

AROUND THE YARDS.

Too much exercise makes the meat tough and stringy.

Give the chicks plenty of fresh air. It is life for them.

Raw potatoes are said to be good for diarrhoea in chickens.

Get your chicks down on the ground as soon as possible.

Send your birds to at least one show, and attend yourself, as this is a good place to get pointers from the successful breeder.

An authority says if the egg is placed on the side or large end, the heavy yolk will settle to the bottom and come in contact with the shell, which admits the air. If it is placed on the small end, it will always have a layer of white between it and the shell.

White China Geese.

Can you give me the address of any one from whom I could get White China geese? Either eggs or stock.—W. H. M., Sanger.

Also C. S. L. of Lumpoc and F. S. W. of El Centro ask similar questions. We wish, if any of our readers have White China geese for sale, they would send us their names and we will forward same to those inquiring for same in this issue.

Turkey Trouble.

I have a small flock of fine turkeys hatched last April; they are very fat and heavy; about a month ago I had two of them die in one week, yesterday another died of the same symptoms. Their heads and necks were swollen and they drooped around for a couple of days.—Mrs. W. S.

You will have to give us more symptoms of the disease, as it is impossible for us to tell what ails your birds with the meager description you send.

Chicken Pox.

The chickens in this part of the country have some disease which some call roup. Can you tell me through the Cultivator what it is and what to do for it? I wish to be prepared if it breaks out in my flock, as I have several hundred fine White Leghorns. Black lumps form on the comb, in the corner of the mouth or sometimes on the head. In some cases the eyes swell, run and fill with a yellowish white, cheesy matter, which can be taken out in chunks sometimes as large as a pea. Often the same can be found in the roof of the mouth. There is no coughing or sneezing, but when the matter is found in the mouth they run from the mouth a sort of thick water same as discharged from the eyes.—W. H. M., Sanger.

The trouble you speak of is chick-

50 Cent Eggs

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

en pox. A good remedy for same is to anoint the afflicted parts frequently with carbolated vaseline, removing the crusts, as they soften and yield to gentle rubbing.

In the issue of September 19, we published a splendid article on chicken pox, which everyone should read and read again, as it contains much valuable information.

SAN JOSE POULTRY SHOW.

The San Jose show is becoming one of the big shows of the State. Practically every class was represented this year and most of them were full. Santa Clara county, of course, made the biggest showing, but there were many fine displays from outside points. Los Angeles sent in a large number.

In speaking of the display, Secretary Brooks said:

"There is the greatest quantity of high class birds ever exhibited in California. Many of the pens and single birds are bringing excellent prices. One single bird was sold yesterday for \$35, and \$100 was offered for pullets and refused. The sum of \$75 was paid for one pen and from present indications on Friday and Saturday, the prices will be the highest ever paid for birds at a California exhibit. This buying of birds is specially confined for the present among the exhibitors themselves, and some fanciers who have taken a special liking to blue ribbon fowls and fabulous prices and offers are expected to be made between now and Saturday.

"Every available space has been utilized during the present show, with exhibits from all parts of the coast, and the Santa Clara Valley poultry and Pet Stock Association has decided, that if it can be possible, a larger and more convenient pavilion will be erected and used next year. The great interest manifested in the present exhibition demands that large and more commodious quarters be procured for next year's show.

"From personal conversation I learned that twice the present space will be necessary next year, as during the coming year many people will enter into the poultry business with a vim which has never been seen before. The various high class prizes offered are special inducements to people to take up the splendid work already done and to try, if possible, to excel in the poultry line."

Following is a list of the awards:

Barred Plymouth Rocks—1, 2 pen; 1 cock; 5 cockerel; 1 hen; 5 hen; 2, 4 and 5 pullet, Moore & Mann; 3 pen; 4 cock; 2 cockerel; to M. Bassett. 4 pen; 5 cock; 4 cockerel. Mrs. G. A. Robertson. 2 cock; 3, 4 hen, J. C. Naylor. 1 cockerel; L. N. Cobblewick.

White Plymouth Rocks—1, 2 pen; 1, 2 cock; 1, 2, 3, 4 and 5 cockerel; 1, 2, 3 hen; 1, 2, 3, 4 and 5 pullet, Mrs. D. A. Robertson. 4 and 5 cockerel, J. B. Clayton.

White Wyandottes—1, 3 and 4 pen; 3 cock; 2 cockerel; 3 hen; 5 pullet, Mrs. W. E. Wilson. 2 pen; 1 hen, J. M. Nelson. 1 cock; 2 cockerel; 1 pullet, J. A. Evans. 4 and 5 cock; 1 cockerel; 5 hen; 3 pullet, Miss Clara Smith. 2 cock; 4 hen, Mrs. M. R. Taylor. 2 cock; 4 hen; M. F. Fisk.

Buff Wyandottes—1, 2, 3, 4 and 5 pen; 1 and 2 cock; 1, 2, 3, 4 and 5 cockerel; 1, 2, 3, 4 and 5 hen; 1, 2, 3,

Concluded on Page 506

LILLY'S BEST COMMON SENSE EGG FOOD

Contains all the elements necessary to build eggs and make feathers grow. Prepared specially to meet the needs of both the laying and moulting hen. A full meal of this splendid tonic once a day during this trying period is a necessity. Read these opinions of practical poultrymen.

"I feed about 1000 hens and about 200 of my best breeders on Common Sense Egg Food. I am satisfied with the results. Healthier hens, stronger hatching eggs, stronger chicks." J. BEADLE, Brooklyn Heights Egg Ranch.

"Your Egg Food is all right." CHAS. MCENTRER, San Luis Obispo, Cal.

"Common Sense Egg Food is the best stuff for chickens." Geo. Striker, Snohomish, Wn.

Bees and Their Care

A SWARMING BOX.

A swarming box is handy in the bee yard. It resembles a corn popper with box 12 or 16 inches by 8 or 10 the other way. The long handle should go clear through the box to strengthen it. Make the box of very light wood. The biscuit boxes have the right material to make one. Bore inch holes in the sides to give the swarm air. With this swarming box you need not mutilate your shade trees to get swarms, but can collect on in this from anywhere—from a fence post or from your neighbor's fruit trees when he reports with dismay that a swarm has alighted there. A handle 10 or 13 feet long will do very well if it is fruit trees or ornamental shrubbery that are near enough to furnish alighting places for your swarm. But if you are near tall trees, the longer the handle the better. Bees can be carried from any point in the neighborhood in this box, they clinging to it as if it were home. They are easily dumped from the swarming box on the alighting board before the new home which you have made ready.

A good assistant to go with this box is another long slender pole with a hook on the end of it, so when you put this box under a limb holding a swarm, with the hook catch the limb just beyond the cluster and give it a jerk. Of course, the air will be full of bees and buzzing. But wait awhile, if they do not settle in your box, shake the branch again and keep at it until your bees get tired of such a wiggly bush and settle on the quiet box.

A gentleman passing the house one day said there was a swarm of bees on a fence post a mile and a half away out at the cemetery. One of the boys took the swarming box and got it. He got it home safely more to see if he could do it than from its value, as it was too late in the season for it to build up without help.

I remember once a swarm that would not stay in the hive I prepared for it, but kept coming and going back on the same tree. The third time I got it in my box I car-

ried it into the cellar to cool off and left it there all night. The next day when I took it out and emptied it down in front of the hive the bees went in like good children and went to work.—Farm Stock and Home.

HOW TO HIVE HIS BEES.

H. W. N., Fort Apache, Arizona, writes:

"I have found a wild honey bee tree and would like to know if you can tell me how I may cut the tree down and save the bees and place them in a hive in my garden. A swarm left the hive and a neighbor of mine found them on the branches of another tree close by and has placed them in a large box with a few sticks for them to build combs on and they have gotten busy already. There are lots of wild bees in this country and as the bee trees are found they are cut down, the honey extracted and the bees left to die and shift around through the cold winter. I have a mint of valuable information in these old Cultivators as to their care, so if you will kindly give me the information I desire, I will greatly appreciate it.

A practiced beekeeper to whom the above question was referred, says he saves swarms of bees which go into trees by setting hives a little distance from the tree, in which he puts comb

cases, with molasses at the mouth of the hive, and also in the hive. When the bees discover the hive they will go to work, and as soon as this is done he smokes the tree until the bees leave it, which they will do in a short time and take to the new hives. He then removes the honey, being careful to leave enough near the mouth of the hive to keep the bees from starving until the new hive is established. While the smoking process is under way, a noise at the new hive, made by heating a tin pan, will attract the attention of the bees and direct them to their new quarters. Care must be taken to protect the body from the angry bees meanwhile.

WORKING THE BEES.

Nature has given us the bee to bear the pollen from tree to tree. It is the same with corn and many other plants. Rag weed has an abundance of fertilizing pollen. How can we get the bee attracted to this work? The same as the child is attracted by candy. The tree offers the bee a sweet secretion to induce it to come and take the pollen to other plants. It is a curious provision of nature to improve the productions of fields, orchard and garden.

Nothing is done at random, but everything by a system. Fruits put on their most brilliant colors when in blossom for the purpose of attracting the bees. The workers have

large and keen eyes to detect these things. If the hive is large and the queen not crowded there is but little trouble with the bees. The red clover is no good for bees as the honey is too deep for them to reach. Alsike clover is by far the best for honey. In short, you cannot be a successful fruit raiser without bees. Spray after the pollen is fallen. Bees never puncture fruit, but this is done by a bird. This bird will puncture grapes quickly and then it is charged to the bees. Look to these insects and make them your friends.—Ella Stockman, in American Cultivator.

BEEKEEPING.

Apiculture is proverbially regarded as the poetry of agriculture. Of agriculture George Washington said: "It is the most noble industry of man." We would, therefore, flatter ourselves in being fortunately interested in an art worthy of the most strenuous efforts to advance it. As a business proposition, we have evidence from all thrifty beekeepers, on all sides and in all States, that keeping bees pays. Not a little care is necessary, and this attention is imperative at just the right moment; but on the investment the interest is great. Some have considered that beekeeping has had its day; true, the old style. We have done with the box hive and with honey strained through an old blanket, as the Indians used to do. We have found that the crops can be increased, and the profits advanced by modern manipulation.—Burton N. Gates, Expert in Apiculture for the U. S. Department of Agriculture.

TALLERDAY SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only way to Irrigate Alfalfa. Cheaper than Flumes. This is only one of our specialties. We make Riveted Water Pipe in lengths of ten feet from single sheets. Let us prove to you that we make Pipe and Tanks right. WRITE FOR CATALOGUE.

LOS ANGELES, CALIFORNIA.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

To Grow Eucalyptus.

Please answer in query column if regard to planting eucalyptus seed. If any special care is necessary would be glad to know.—Chas. G. Smith.

If your are planting on a small scale, or have flats enough, use these for seed boxes. Sift the soil so as to remove stones of hard lumps and add a little leaf mould, if you have it, to make seed bed soil. Do not use cow manure even two years old for the young plants cannot stand it. Neither use it when transplanting into flats. Pack the soil into the flats when moist enough to handle well, so that it will not settle out of level when soaked. Wet it down thoroughly and even up with a board when dry enough. Have a board long enough so that it will extend over the sides and notch the ends so that it will extend down about an inch below the top of the boxes. Sprinkle the eucalyptus seed over the surface so that they will be about a quarter of an inch apart. Press them into the soil with a board. Sand the board if the seeds stick to it. Have another board like the one described above for leveling, only have the notches in the end less deep by half an inch. When this is dragged over the top of the box as indicated above, it will not touch the soil by half an inch. Pour pure sand over the seeds and press it down till firm, pass the second board over this and it will remove all of the sand that lies over half an inch deep.

Keep sprinkled moderately, just enough to keep the lower part of the sand from drying out. When the trees come up, do not keep them any wetter than is necessary to bring up the seed. It is better to water them about half as often. There is danger of them damping off if the precaution is not observed. When the trees are about three or four inches high, transplant to flats.—J. W. M.

Worms.

I find upon examination of my young chicks that have died, that the cause was worms.

Some were two inches long, pointed at each end and stiff as wire and had pierced the gall bladder of one examined, another had pierced the gizzard.

They seem to be indigestible and are not confined within the digestive organs, but find their way into the abdominal cavity. Is there a preventative?

What is the cause? Do they eat them for food.

My chickens run free and have access to stable manure and perhaps foul water from drainage since the rain.

They have plenty of proper food and drink.

I am confining them and giving turpentine in food and water.—Perplexed.

The worms are intestinal worms and no doubt the manure pile and foul water is the cause. Turpentine in soft food and in the drinking water will rid them of the trouble. We published the proportions a few weeks since in these columns.

Grit.

Will you inform a subscriber at San Jacinto, what kind of grit, if any, do chickens require while running at

large on coarse sand or gravelly soil. Will they pick up all the grit they require? Would also like to inquire if ground bone is necessary? Also if ground oyster shells is necessary in order to get the best results, or do they require oyster shells while ground bone is being fed.—J. W.

Birds running on range will pick up enough grit to do them. Ground bone is not necessary, but it is one of the best foods. For best results, keep oyster shell before laying hens all the time, no matter what you are feeding, as it is necessary in forming shell of the egg.

Apples for Upland.

I have seen your article about apple trees in California and would like to know what would be the best varieties for me to plant. I am about two miles from the mountains; have heavy loam soil about two miles north of Upland. Also where is the nearest experimental station?—N. R. Galloway.

The best apples for your location are Red and White Astrachan. These are early summer apples and sell better than late varieties with the exception of perhaps Rhode Island Greening. The winter apples ripen at the wrong time to make good quality.

The nearest experimental station is at Riverside, but there are no bearing fruit trees of any kind at that station now. It was started but a few years ago.—J. W. M.

Gum Diseases.

Please give formula for treatment of gum disease on orange trees and how prepared? Is the disease contagious? Can it be started by careless pruning and is there any known cause for it?—W. David, Pomona.

Gum disease is caused by improper conditions of the roots and soil as far as can be learned. Trimming out the dead bark a case it is formed that starts below the surface and treating the wound with crude oil will help it. In the case of scaly bark gum disease, paint with crude oil.—J. W. M.

Peach Blight.

I notice after pruning my peach trees there has been a flow of gum which hangs in chunks on the ends of nearly all limbs and cut places. Will you please tell me if this is a disease and if so, what is the remedy?—J. F. M., Princeton.

It is evidently the peach blight, though not entirely characteristic. Spray after pruning with Bordeaux mixture. As late in the spring as possible, just before the blossoms open, spray with the lime, salt and sulphur remedy.—J. W. M.

Budding Over Apricot Trees.

I have some apricot trees eleven years old; large trees, but they have never borne any fruit to speak of. I would like to work them over to something else.

Do peaches graft or bud successfully on apricot stock?—There is a variety of apricot near that has borne well in years gone by. I will either work the trees over them or else to peaches, and would like your opinion as to which is best.—G. L. Hawley, Madera.

Never attempt to graft onto old apricot trees. The wood is too hard to make a good union. After the fruit is off in the summer, cut the

tops off and bud the suckers in the fall. Thin the suckers out after they have made a good start, leaving those which you wish to bud into. Wax the stumps as soon as the branches the cut off. Bud apricots onto the sprouts. Peaches do not make a good unions on old apricot and buds are liable to blow out. If you want Kelsey plums, there is nothing better for a stock than apricot.—J. W. M.

Grape Cuttings.

I would like to know if it is all right to make grape cuttings off a vineyard that has more or less mildew? If so, I will pick out the vines that has no mildew this fall. And would also like to know where I can get a book that tells all about English walnuts and different varieties.—H.

It is all right to make grape cuttings from mildewed vines, but it is a good idea to dip them in Bordeaux mixture before planting. If the nursery is on low ground, mildew will attack them if you do not sulphur them there also.

There is no book that gives information on English walnuts as they are grown in California. The Cultivator gives up-to-date information on walnut culture.—J. W. M.

Lung Worm.

Our calves are born strong, but when fed on whole and separated milk, half and half, get drowsy. Won't get up to eat. I get them up and they seem weak in the back and stagger; eyes discharge some. No bowel trouble. Several have died. It seems contagious. We put one that had it with others and they all were sick.—G. W. S.

Examine for lung worm. Remove the sick calves to a board floor where the worms will show. Put the well calves into a fresh yard and spread lime, or spray with crude oil on the ground. If lung worm, it is passed from animals by the worm coming from the earth or floor. The worm is a small parasite. I know of nothing else that their symptoms indicate.

Warts.

Will you kindly advise me whether warts on cow's udder can be permanently removed. Warts are long and slender and seem to be forming groups around the teats.—F. C.

Clip the warts off close with pair of sharp scissors. Then cauterise the root and pencil with nitrate of silver.—W. J. Oliver, V. S.

Glanders in Cows.

Do cows ever have glanders; if so, how does it affect them?—A Subscriber.

I have never seen a case of glanders in cows. I believe they are immune to the disease. If your cow discharges from the nose and has a cough you probably have a case of tuberculosis.—W. J. Oliver, V. S.

Ayrshires.

Inquiry is often made at this office as to Ayrshires. Are any kept in this State? Will subscribers who know, write us?

SAN JOSE POULTRY SHOW.

Continued from Page 504

4 and 5 pullet, H. Berrar. 3 cock, Wm. J. Fox.

Silver Pencilled Wyandottes—All Awards to Mrs. Geo. Grindell.

Columbian Wyandottes—1, 2 and 3 pen; 1, 2 and 3 cock; 1, 2, 3, 4 and 5 cockerel; 1, 2, 3, 4 and 5 hen; 1, 2, 3 and 4 pullet, Geo. Leaman. 2 cock; 5 pullet, B. Dent Taylor.

S. C. Rhode Island Reds—1, 2 and 3 pen; 1, 2 and 3 cock; 1, 2, and 3 cockerel; 2 and 3 hen; 1, 2 and 3 pullet, J. D. Kenney. 4 cock; 4 cockerel; 1 hen; 4 hen, W. R. Alexander. 5 hen; 5 pullet, D. G. Bishop.

R. C. Rhode Island Reds—1 cockerel; 2 pullet, Daniel Wright, 1, 3 and 4 pullet, E. L. Patterson.

Light Brahmas—1 and 2 pen; 1 and

2 cock; 2, 3 and 4 cockerel; 1 and 2 hen; 1 and 5 pullet, Mrs. E. F. Reed. 1 cockerel; 2 pullet, W. R. Struthers. 3 and 4 pullet, Adolph Sutro.

Black Langshans—All Awards to G. H. Wheeler.

White Minorcas—All awards to A. B. White.

White-Faced Black Spanish—All awards to Robt. A. Rowan.

S. C. Buff Orpingtons—1, 3, 4 pen; 1, 2 and 3 cock; 2, 3, 4 and 5 cockerel; 1, 2, 3, 4 and 5 hen; 2, 3, 4 and 5 pullet, W. S. Sullivan. 2 pen; 1 pullet, Jesse Martin. 4 cock, M. J. Gregg. 1 cockerel, H. Berrar.

S. C. Black Orpingtons—1 pen; 1 cock; 3 and 4 cockerel; 1, 3 and 4 hen; 1, 2, 4 and 5 pullet, H. Berrar. 2 pen; 2 and 3 cock; 5 cockerel; 2 and 5 hen, H. W. Gessner. 1 cockerel; 3 pullet, John Craib.

White-faced Black Spanish—1, 2 and 3 pen; 1, 2, 3 cock; 1, 2, 3, 5 cockerel; 1, 2, 3, 4 hen; 1, 2, 3 pullet, Mrs. D. A. Robertson. 4 cockerel; 4 and 5 pullet, Mrs. Mary H. Taft.

Silver Polish—All awards to Robt. A. Rowan.

Golden Polish—All awards to Robt. A. Rowan.

Black Hamburgs—All awards to Robt. A. Rowan.

S. S. Hamburgs—1 pen, W. H. Hannibal. 2 pen; 2 cock, W. E. Crouser. 1 cock; 1 cockerel; 1 and 2 hen; 1 and 2 pullet, R. A. Rowan.

Golden Pencilled Hamburgs—All awards to W. D. Crouser.

Cornish Fowls—1 cock; 4 cockerel; 1 and 2 pullet, John D. Mercer. 2 cock; 5 pullet, Mrs. W. C. Bogen. 3 cock; 1 and 2 cockerel; 1, 2, 3 and 5 hen; 4 pullet, W. K. Kreig.

White Indians—All awards to Magnolia Poultry Yards.

Golden Sebright Bantams—1, 2 and 3 pen; 1, 2, 3, 4 and 5 cock; 2, 3, 4 and 5 cockerel; 1, 3, 4 and 5 hen; 1, 2, 3, 4 and 5 pullet, E. G. Moore & H. F. Mann. 1 cockerel; 1 and 2 hen, W. C. Bogen.

Silver Sebright Bantams—All awards to Robt. A. Rowan.

Buff Cochins Bantams—1 and 2 cock; 2 cockerel; 1 hen; 2 pullet, R. A. Rowan. 1 cockerel; 1 pullet, L. R. Frost.

Black Tailed Jap Bantams—All awards to W. C. Bogen.

White Polish Bantams—All awards to Robt. A. Rowan.

R. C. Black Bantams—All awards to Herbert J. Riley.

Red Pile Game Bantams—All awards to Robt. A. Rowan.

B. B. Red Game Bantams—All awards to F. D. Sopher.

Bronze Turkey—All awards to Wyman & Son.

White Holland Turkeys—1 old cock; 1 young cock; 1 old hen; 1 young hen, Mrs. W. C. Bogen. 2 old cock; 2 old hen, B. J. Horn.

White Indian Runner Ducks—All awards to C. C. Spencer.

Indian Runner Ducks—All awards to Wyman & Son.

Pekin Ducks—All awards to Mrs. G. E. Hickey.

Alesbury Ducks—All awards to B. G. Huntley.

Toulouse Geese—All awards to G. E. Hickey.

Chinese Ring-Necked Pheasants—All awards to Earnest L. Wilder.

One of the attractions of the San Jose show was the exhibit of Alesbury ducks exhibited by Mr. B. G. Huntley. At this show, as at the State Fair, held in September at Sacramento, Mr. Huntley won all the prizes offered on Alesbury ducks. While at the State Fair, we heard a gentleman say that the exhibit of Alesbury ducks was the best since he left England, the home of the Alesburys.

THE CONTROL OF THE BLIGHT.

Continued from First Page
churned together, strained, and diluted with the remainder of the water.

Relation of Spraying and Pruning.

The early time of spraying recommended for blight control is apt to find the trees unpruned and with considerable foliage still on the branches. This at first seemed a serious obstacle to some, but experience has shown that even in this condition the trees may be sprayed with perfect success, provided a thorough job is done. It is very desirable to have the trees pruned before spraying, and this should be done, if possible, but spraying should on no account be delayed beyond the proper time because the trees are not pruned. If the pruning cannot be done in time the spraying should proceed very thoroughly, and the pruning done later.

Application of the Spray.

The effort should be made, above all, to cover all the branches and fruiting twigs completely with the spray. The inexperienced workman soaks the trunk and main limbs, but leaves untouched much of the small growth which bears the fruit and which the blight particularly affects. In order to check the blight infection on the twigs, those twigs must be completely covered with spray before infection occurs. The least portion of a twig left uncovered is as exposed to infection as though there was no spray on the tree at all. An experienced and conscientious sprayer goes over his trees systematically and completely, leaving no portion uncovered and yet wasting no material.

PRESERVATION OF FENCE POSTS.

The Cultivator is often asked for wood preservation formula. From a Department circular we quote the following:

Experimental tests made by the government with a number of inferior woods have shown that it is practicable to subject them to preservative treatment by which they will be rendered durable and as lasting as the soundest oak in many cases.

This is of the highest importance in connection with the use of fence posts, telegraph and telephone poles, cross ties and constructive timbers of many kinds. It is of special importance to farmers in many parts of the country, for with them the fence post problem is serious.

Almost every farmer in the South and East knows that the supply of locust, white oak, cedar and other durable woods has become so restricted in the last few years that their cost has become almost prohibitive. In the Middle West the supply of good post material always was limited while in many places in the far West it is becoming more and more expensive to build fences because good timber for posts is becoming very scarce. The fence-post problem, therefore, appeals to the farmers of the whole country, and they will be benefited by any process by which a poor post may be made to give double or treble service.

The preservation treatment can be employed more successfully with certain kinds of wood than with others, but it fortunately so happens that the open-grained, quick-growing, quick-decaying timbers are the easiest of

all woods to treat. Among these are old field or loblolly pine of the South, lodgepole and Western yellow pine, cottonwood, willow, buckeye, beech, sycamore and others in the West and Middle West.

Woods which decay most rapidly in their natural state, with few exceptions, are best adapted for preservative treatment. This is important because it renders cheap and abundant timbers available and makes use of what would otherwise be wasted.

The process of treating farm timbers is simple, and the cost is low. The apparatus may be set up and operated by a farmer on his own premises, or two or more farmers or timber users may join and lessen the expense for each. The only apparatus required is an open iron tank, large enough to receive fence posts in an upright position. Shingles, stakes and other small timbers may be treated in the same tank.

The cost of treatment after the apparatus is ready, depends upon the size of the timbers and whether the entire posts or only the butts are treated, and the thoroughness of the treatment. Where freight rates permit the shipping of the preservatives at a moderate expense, the total cost of a treated post of old field pine, lodgepole pine, cottonwood or similar timber, ought not exceed that of a high grade post in its natural state, and is often less.

The government considers the investigations in the preservative treatment of timber of such importance that the business of one branch of a bureau in the Department of Agriculture—the "Office of Wood Preservation" in the Forest Service, is given over entirely to the work of experiments in co-operation with railroad companies, mining corporations and individuals in prolonging the life of railroad ties, mine props, bridge timbers, fence posts and transmission poles. Advice and practical assistance is furnished all who request it of the Forester. The lengthening of life of timber means the saving of thousands of dollars annually through doing away with the heavy expense of labor and cost of material for renewals.

A GOLDEN BUTTER MINE.

When it comes to separators there is one different from all others; one XXth century separator; one separator with suspended instead of supported bowl; one oiled automatically yet perfectly lubricated machine; one separator without bowl contents; one plain, smooth bowl separator; one simplest constructed separator—the Tubular. It costs no more to get the best than to buy an inferior "bucket bowl" machine.

These exclusive and invaluable advantages belong to and are held by patents and processes of manufacture for the people who use the Tubular in their dairies.

They are facilities and conveniences not to be purchased nor secured in other separators.

By their help the dairyman and dairywoman can equip his or her home dairy to gain a share from the butter gold mine which exists in every community of the United States and which needs only intelligent working to yield rich profits.

Isn't it time for you, Mr. Dairyman, to be thinking of your butter gold mine, right at your home, ready for the working, capable of yielding big and constant rewards, if only you work it properly?

If you think "yes" write to the Sharples Separator Company, West Chester, Pa., for their "Business Dairying" hand-book and regular catalogue. Both free, if you mention this paper. Both books will help you in getting ready to gain largest possible profits from the butter gold mine.

You can get a Tubular at the regular price, and the dairy help and profit the Tubular stands for. You may get a piano—some 1907 purchaser of a Tubular will get the instrument.

But the upward-tending price of butter, and the certainty of a permanent good price for good quality, are the ample reasons why you should be seeking the world's best centrifugal separator, inquiring about and getting acquainted with the Tubular, and shaping your dairy business to share in the gains that the world is giving yearly in larger measure for excellent butter.

Oliver Steel and Chilled Walking Plows, Sulkies

and Gangs with Chilled or Steel Bases

Cut shows No. 7 Vineyard, one of the new members of the Oliver Plow family, especially interesting to Orchardists, Vineyardists, Berry and Vegetable Growers. Furnished with either Chilled or Steel Shares.

THANKSGIVING.

Were there no God, I still would thank the source, though all unknown,

Wherein are born the joys of men, the gifts I call my own.
The heart impels the tongue to speak since to my lot belong
A woman's love, a sheaf of grain, a lily and a song.

The savage beast, the poison vine, the evil of the earth,—
I know not if the good and bad were only one at birth;
But all the world seems gracious when I set against the wrong
A woman's love, a sheaf of grain, a lily and a song.

—Nixon Waterman.

THANKSGIVING WAR STORY.

AN OLD soldier tells of a Thanksgiving spent during the Civil War in a Maryland camp, when he, a young soldier, with his messmates, planned to dine on roast turkey and pig, and why they ate hard-tack, bean soup and drank black coffee, giving sincere thanks for the hard fare. Mr. Wilson says:

"On the day before Thanksgiving the young men in our company were restless, discontented, homesick, heartily tired of inaction, delay and scanty rations. Maryland was many miles distant from home, the camp ground unpleasantly located.

"In the camp's vicinity Mrs. Hill, a 'war widow,' lived with two daughters in a plain, comfortable Maryland farmhouse. Her husband and two sons were in the Confederate army, the colored people were gone. The women were thrifty, industrious, successful farmers.

"On the day before Thanksgiving our cook intimated that Mrs. Hill's large, fat turkeys and young pigs were in prime condition for roasting.

"A young comrade and myself determined to disregard the strict orders regarding confiscation and secure for the Thanksgiving dinner one of the Hill turkeys. It was an easy matter to evade the guards and creep close up to the poultry house without being detected. Mrs. Hill had ceased to regard the Yankees with suspicion, our boys had behaved so well during our stay.

"Somebody was singing in the farm-house parlor. We listened.

"I must have a peep at that singer," said comrade Barr.

"We crept close up to a window, peeped through a rent in the window curtain into the homelike, cheerful parlor.

"One of our own men, a young soldier, wearing a blue uniform, sat at the piano, playing soft chords, and singing in a sweet, appealing, wooing, charming voice:

Then he sang a stirring warning admonition:

'A charge to keep I have.'
'Ten thousand foes arise.'
'My soul be on thy guard'

"We turned about, hastened to camp, flying from temptation, the ringing voice sounding in our ears:

'The hosts of sin are pressing hard.'

"We were berated by the disappointed men when we returned empty-handed. Two older men volunteered to visit the pigsty and poultry house, promising to return full-handed. They, too, returned empty-handed.

"Steal the widdler's turkeys!" exclaimed comrade Powers. "We hadn't the heart to lay hands on one of the gobblers. Oh yes, we could have bagged 'em easy. We heard a planny in the house an' stopped to listen to

the music. We peeked in at the window. The widdler, the two girls and a young fellow were singin'

"How firm a foundation."

The widdler sat darnin' stockin's jest as my old mother in Vermont is likely doin' tonight. Who do you think was playin' the pianny? Comrade —, a boy wearin' the blue, an' them Southern wimmen air tratin' him like home folks. Boys, that fellow's singin' is preachin'. He can preach. He did preach, "love your enemies." We'll eat hard tack tomorrow an' give thanks. We're to honest to steal pigs from lone wimmen. The singin' chap'll sing tomorrow in chaplain's tent, an', boys, when you hear him sing you'll hear somethin' sweet and touchin'."

"On Thanksgiving Day we ate our scanty dinner sincerely thankful for the absence of stolen turkey. At the Thanksgiving service our young comrade sang for us, sang his way into our hearts.

"Our comrade is yet singing in his peculiarly winning voice to thousands of care-encumbered listeners. His voice is yet sweet and appealing, comforting, admonishing, entreating and inspiring, matured and cultivated, sweetened by his great love to the world."—The Independent.

* * *

*The sweet singer referred to was Ira D. Sankey.

THANKSGIVING DECORATIONS.

Nothing is prettier or more appropriate at the Thanksgiving season than the countless decorations which autumn herself provides. In fact, there are so many possibilities that it is difficult to decide which to use. In a household where there are children, great sport is afforded, not only on Thanksgiving Day, but for many evenings preceding it, in cutting pumpkins into fanciful shapes, for decorating the room. This is an old idea, but when carried out with other vegetables, some amusing as well as unexpectedly pretty results can be obtained. While bouquets of very natural looking flowers can be carved from such commonplace things as carrots, turnips, beets and potatoes. In fact, there is almost no limit to the possibilities when bright boys and girls set their wits to work.

For those who prefer daintier effects the woods yield rich stores of leaves, vines and bits of brightness. Chrysanthemums seem especially appropriate at this season, and make a beautiful centerpiece, while nothing is prettier than a platter of fruit, surrounded with autumn leaves.

One of the most typical harvest decorations is made by using a basket of bearded grains and grasses for a centerpiece, with smaller clusters at each place. A novel bouquet holder, and one that is very effective, is made by hollowing out a good sized cabbage, to hold a vase of flowers. The curled green leaves of the vegetable are very pleasing in their effect.—Am. Poultry Journal.

Have you noticed our Christmas suggestion and offer on the editorial page? Don't you think it is a good one? If you feel like the reader who writes the following, you will find the blank and fill it out. J. P. J. "I would not think of keeping house without the CULTIVATOR. It is in very truth "the home-makers guide."

One ranch at Perris is to put out five hundred acres of alfalfa.

A TYPICAL THANKSGIVING DINNER.

Thanksgiving is not so much a time of dainty menus as it is a reversion to the good old days of our grandfathers, when the fruits of the farm were the feature of the day. One can get unusual and fanciful side dishes at any time of the year, at the expense of a little time and patience, but when Thanksgiving Day comes, nothing tastes quite as good as a big turkey, flanked by the simply prepared and common vegetables, and followed by generous slices of mince and pumpkin pie. In many families the turkey must be supplemented by chicken pie, or else the traditions of the day are not complete.

Old-fashioned chicken pie: Line the bottom and sides of a deep baking dish with cold boiled chicken, cut into convenient pieces, and the bones and skin removed. Cover with gravy, and instead of placing the usual crust over all, cut pieces with a biscuit cutter, and cover the top with these. They are much easier to serve than the usual top crust.

Creamed onions: Remove the outer skin of the onions and let them stand in salted water for half an hour. Boil in salted water until tender, drain, and pour over them a cream gravy, made by stirring together two tablespoonfuls of butter and one heaping tablespoonful of flour, and adding warm milk, stirring constantly. Let this boil up, and pour over the onions, adding seasoning to taste.

Squash in the shell: A pretty way to serve squash is to steam and mash it as usual, but instead of serving in a vegetable dish, fill the hollowed out shell of a squash with it. Let the mashed squash be heaped well above the top of the shell, in cone shape, and mold it, with the handle of a fork, as butter is often molded, in "pineapple" shape, putting bits of butter on it just before bringing to the table.

Cabbage omelet: This makes a pleasing change from boiled cabbage. Cook the cabbage the day before using. Chop fine, add a liberal amount of seasoning, a cupful of milk and two well beaten eggs. Put in a buttered baking dish, and bake till the custard sets.—American Poultry Journal.

ROAST TURKEY.

If you haven't raised a turkey for your Thanksgiving dinner resolve to do so before another year. When one prices a plump turkey and finds it necessary to dig up about five dollars of this new, hard times scrip, which we are compelled to take these days, for a fairly good sized turkey, it causes the economical housekeeper to sigh for a yard where one can go and pick up a plump bird without considering mortgaging the farm to do it.

But assume that you have the bird and have its head off. Then, after picking and singeing the turkey, plump it by plunging three times into boiling water, then three times into cold. Drain, then draw.

Prepare stuffing by grating or grinding bread crumbs fine. Season well with salt, pepper, sage and butter. Put in pan and add enough hot water to moisten well. Cover and let steam, but do not cook over fire. Be careful not to have the dressing too wet. Thoroughly mix.

Rub inside of turkey with pepper and salt, fill with the stuffing. Sew up each slit with a strong thread or

cord. Tie the legs down firmly and press the wings closely to the sides, securing them with a cord tied around the body.

Steam from one to three hours by placing the turkey in dripping pan, on pieces of wood (hardwood, which will not give off flavors) laid in bottom of wash boiler, with just enough water to cover the wood.

Put on the lid, which should fit tightly, add water as necessary. Steam one to three hours, as to size. Add the liquor in the dripping pan to the turkey and place in oven. Lard the turkey, or place on the breast three pieces of fat taken from it before it was stuffed. Sprinkle with salt and pepper, dredge well with flour; if not sufficient water in pan, keep adding and baste often, as the excellence of the meat depends on this. Cook until a nice brown and perfectly tender.

Remove to hot platter and serve with cranberry sauce and giblet gravy.

More Economical.

If the price of turkey is too great for you to get the customary Thanksgiving turkey, turn your attention to something more economical, yet very good. Plain boiled chicken with its accompaniment of gravy, baked "dumplings" (which may be baking powder or soda biscuits covered with gravy), mashed potatoes and some vegetable, turnips or squash. Or if the chicken be not desired, have roast pork, which, with dressing, seems almost as satisfying as the turkey.

This, with cranberry sauce or jelly, nut or tomato salad, and the regulation pumpkin or mince pie, will afford you a fine and satisfying Thanksgiving dinner without an extravagant outlay of money. After all, it is not what you eat, but the spirit of the eating, that makes the day complete or otherwise.

A simple meal, eaten with happiness and contentment, is more to be desired than the more elaborate meal without that contentment and thankfulness.

HOMELY HINTS.

For earache warm a teaspoonful of olive oil over the steaming spout of the tea kettle and drop it gradually into the ear, plugging with antiseptic cotton. For earaches which cannot be relieved by this treatment a physician should be consulted.

A bottle full of hot water at the back of the neck will often cure nervous headache.

For neuralgia on the left side of the face put the right hand in water as hot as can be borne. If the pain is on the right side, hold the left hand in the water. Neuralgia is purely a nerve ailment as its name implies, and this simple treatment warms the chilled nerves which are suffering.

A DISAGREEABLE HABIT.

To prevent children from biting their nails buy a tube of liquid court plaster. After cleansing the hands thoroughly apply a drop to each finger nail, spreading it evenly over the top of each nail.

Allow this to dry three or four minutes before using the hands. It will form a hard, smooth scale which sticks very tight. In order to remove it the child must willfully bite it off, and most children only bite their nails through nervousness. Renew the application every other day, soaking the previous plaster away, and stimulate the pride of the child by a talk on the improved appearance of the nails.

Books and Papers

CYCLOPEDIA OF AMERICAN AGRICULTURE.

Those who have seen the four-volume edition of the Cyclopedia of American Horticulture will need but little to convince them of the worth of another new publication also edited by Prof. L. H. Bailey of Cornell University. This is the Cyclopedia of American Agriculture. It is also a four-volume book of which two volumes are now ready for delivery. It is along somewhat different lines than the Cyclopedia of Horticulture in this, that it does not have the alphabetical arrangement of topics as does that book.

The first volume has to do with the soil, its use and abuse, and in it, of course, comes extended reference to irrigation, both historically and as to practical application. Volume 2 has to do with the products of agriculture, farm crops, etc. In this, of course, are planting tables, farm forestry, profit in the woodlot, marketing of forest and all other crops, etc.

Volume 3 is devoted entirely to farm stock, and is subdivided into "General Principles," "Animal Industry or Technology," "Descriptive Articles." Stock breeds are described by expert judges.

Volume 4 has to do with social economy in the country. The features of this volume will be: The History and Development of Agriculture in North America; Short Biographies, with portraits of persons who have been identified with, or instrumental in the progress of American agriculture; A Bibliography of agricultural writings relating to North America; A Symposium of discussions on Economic Questions, such as Taxation, Farm Labor, Co-operation, and the like; An interesting treatment of Rural Society, neighborhood improvement plans, country schools and similar social and economic topics.

TYPES AND BREEDS OF FARM ANIMALS.

A book which should be in the library of every stock owner in this State is, "Types and Breeds of Farm Animals" by Chas. S. Plumb, of Ohio State University.

Excepting the burro which we have looked for reference in vain, there is no breed of animals which we have yet looked to it for information, but what we have found a condensed and complete account so far as could be included in a book of its size. It is a book of less than 600 pages; gives the history of the various breeds of horses, from the prehistoric horse down to the present. All the beef and dairy types of cattle are also treated, as well as wool and mutton sheep. Goats are fully treated, the article relating to milch goats being of exceptional interest. There is a description of swine covering almost a hundred pages in its description of the thirteen different breeds.

Every breed is illustrated and often different types of the same breed with a condensed history of each. It is published by Ginn & Company, Boston, Mass.

"Help! Help!" cried an Italian laborer near the mud-flats of the Harlem river.

"What's the matter?" came a voice from the construction shanty.

"Queek! Bringa da shov! Bringa da peck! Giovanni's stuck in da mud."

"How far in?"

"Up to hees knees."

"Oh, let him walk out."

"No, no! He no canna walk! He wronga end up!"—Everybody's Magazine.

WHITE PLYMOUTH ROCKS EXCLUSIVE- ly. The largest flock of prize winning birds in the West. At the late Los Angeles show, 1907, we won twenty-three out of a possible twenty-five prizes. We offer extra bargains in our this year's breeders. Will sell to suit purchaser. Eggs \$2.50 per 15; \$10 per 100. A. J. LITTLE, Monrovia, Cal.

GET INTO THE CHICKEN BUSINESS. I have a job for you. Earns \$45 to \$50 per month; takes half your time. \$750 required. Write BOX 120, Lordsburg, Cal.

AUCTION

1000 LAYING HENS

on the C. W. Duncan Ranch at

SANTA FE SPRINGS

on the Santa Fe Railroad, one and one-fourth miles South of Los Nietos. Take Whittier Electric car at 8:15 to Los Nietos. Teams in waiting.

TUESDAY NOVEMBER 26

At 10 a. m.

This stock consists of all Young laying Hens, mostly Thoroughbred White Leghorns, fancy strains, also a few Buff and Brown Leghorns and one pen of White Rocks. A great many of these are pullets, just commencing to lay. All a choice lot of hens.

Also complete equipment of my chicken ranch, consisting of coops, 12 double brooders, 7 single brooders, feed cutter, house killing machine, 5-gallon sprayer, 4 incubators, pens, egg cases, lumber, etc., etc.

1 single buggy, double driving harness, single harness, 1 engine house, 1 auto house, in fact everything on the ranch. 1 Fine Jersey Cow, coming fresh; 1 Fine Jersey Calf; 1 work Mule; 12 Turkeys.

HOUSEHOLD GOODS.

On account of leaving for the North I am quitting the business and will positively sell everything to the highest bidder for cash in lots to suit. No reserve or limit.

John A. Berington, Owner.

RHOADES & RHOADES, Auctioneers.
Office, 830-832 S. Main, Los Angeles.

INVALUABLE.

I find your paper invaluable to the fruit grower, and have been greatly aided by its suggestions. I wish to say here that I have tried your winter budding and find it a great success and far better than any other method of budding I have ever tried, and especially so with old trees, although I have made a success on both old and young trees. This in itself has been worth more than a year's subscription to the paper. J. D. M'CONCHIE, Reedley.

BEST ALL AROUND.

I consider the Cultivator the best and cheapest all round agricultural paper I have had to with either in this country or Old England, and wish you much success in its publication.—John Ap. G. Williams, San Jose.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

HOLTVILLE, IMPERIAL VALLEY CALIFORNIA.

We beat the world six weeks of grapes, cantaloupes, asparagus and fruits. Pasture for stock all year around.

This means high-priced land. Buy now while cheap. WHITE BRINDENSTINE, Holtville, Imperial county, California.

All Eastern-Oregon has had a banner crop year, producing 6,000,000 bushels or one per cent. of the total wheat crop of the United States. A total crop failure was never known in this section, and many who began work there a few years ago with an empty cart are now riding in automobile. Part of the wheat acreage is leased from the Indians of the Umatilla reservation, who derive an income of about \$200,000 a year from the source.

The State Experiment Station at Washington, has made the report of the results secured from seedling twenty-one hybrid wheats distributed among the farmers last year. The one which has proved the most satisfactory is termed "No. 108." It is a cross between "Jones Fife" and "Little Club." It is said to have an average of fifty bushels per acre.

Citrus Market

LOS ANGELES, Nov. 20, 1907.

The orange market seems to be feeling of the financial condition rather carefully. Prices, so far as quoted, are not startling either way. When any f.o.b. prices are made they are in the neighborhood of \$2.00 or \$2.50. The Eastern auctions are still working off the Valencias, some of which may be storage.

The shortage of cars formerly prevailing in the Central California sections has been overcome and there are sufficient cars now.

Lemons are not especially strong, but the few in hand are taken care of at fair prices.

A dispatch in a local paper from Chicago says:

CHICAGO, Nov. 19.—Lemons rule quiet. The demand is tame. Supply ample and feeling easy. California, boxes 300s extra choice, \$4.75@5.00; 360s, \$4.50@4.75; 240s, \$4.50@4.75; 420s, \$4.00; choice, \$4.00@4.50; 360s, \$3.50@3.75; 240s, \$3.50; 420s, \$2.50; limes, barrels, \$9.00.

Oranges—Trade is rather slow. There are fair receipts of both California and Florida oranges. Nice 126 and 150 size sell fairly, but all others are dull. Trade in oranges, the same as in all other lines, is slow. Boxes Florida, 126 to 150 sizes, \$3.25; 176 size, \$3.00; 200 size to 216 size, \$2.75; 250 to 288 sizes, \$2.50; Mexican, \$4.50@4.75; California navels, \$3.50@3.75; tangerines straps, two boxes Satsumas, \$5.50; barrels, Jamaica, \$5.00. Grapefruit, Florida, bright boxes of 360 \$4.25.

Shipments.
Shipments of citrus fruits to date, 371 cars, of which 208 were lemons. To same date last season, 157 cars, of which 105 were lemons.

THE "SUCCESS" (NO LAMP) INCUBATOR.

The inventor of the "Success" (no lamp) Incubator, Brooder and Automatic Nests, is the author of some very excellent ideas in modern poultry culture which are free to any one for the asking.

The "Success" (no lamp) Incubator, Brooder and Automatic Nests, have taken the BLUE RIBBON at every fair where they have been exhibited. Write for folders.

Six years of careful experiments have demonstrated the practicability of the "Success" (no lamp) Incubator and Automatic Nests.

The Automatic Nests for designating the laying hens are the greatest stride in the science of poultry farming. Write for free folders.

Our poultry buildings and poultry plant plans are acknowledged to be more economical, servicable and easier constructed than any yet devised for the Pacific Coast.

We certainly have just cause to be proud of the splendid achievements of our poultry devices. Write for free literature.

ECONOMY IN BURNING OIL.

The Greenleaf-Compton Company of Los Angeles have put a new Oil Burner on the market which bids fair to revolutionize the burning of oil under steam boilers.

This Burner—The Williams' Recuperative Oil Gas Generator, as shown in cut herewith—makes a gas flame—

FIRST—We bring the fuel to the flame, a highly heated gas, not the spraying of crude oil on brick work, but the placing of the fuel in the highest state of combustion before discharging into the furnace.

SECOND—We operate this device independent of stack for draught, taking all the elements for combustion through the device itself.

From the simple fact that the Williams' Burners can be operated with an almost air-tight stack, both fire box and ash pit doors closed

by the International Harvester Company.

These engines are manufactured on correct mechanical lines. Like every other implement, tool or machine manufactured by the International Harvester Company, they are required to be of the highest order. That implies not only correct principles, but materials best adapted to uses, and workmanship that cannot be surpassed.

The principles were carefully worked out and tested before manufacture began. The record of service of the engines at work for years has abundantly established their correctness, as well as the excellence of materials and workmanship.

One of the greatest things that has been accomplished is dependability, a positive response of the engine whenever called upon. An engine that

(which cannot be done with other burners) proves conclusively that it gives a perfect combustion, makes no smoke and you get all of the best there is in the oil—and the same soft heat that is attained by coal or coke.

The device does not produce that sharp cutting flame that jet burners produce.

These burners are in successful operation in a number of large plants in Los Angeles, and are showing a saving in oil, varying as to conditions of the different plants. They are put in subject to approval.

It is and has been successfully operated in the larger manufacturing establishments east of the Mississippi river in the heating of iron and steel of every form and under boilers of various types, competing with soft coal as low as \$1.35 per ton, defeating electricity on every form of welding.

SELECTING A FARM POWER.

Farmers are now pretty well assured of the great advantages of an engine on the farm, but are often at sea as to what particular make they should buy. Without attempting to settle that question, it may be suggested that they cannot go wrong in making a selection from the admirable line of gasoline engines manufactured

cannot be depended upon to start quickly and positively is of little value anywhere, especially to the farmer whose power jobs require frequent stopping and starting.

Smooth, even-running and generation of the full rating of power is another feature that is only second to dependable starting. Then comes the simplicity and ease of control for which these engines are noted. And lastly, economy. The engines are adapted to the use of gas, gasoline or denatured alcohol for fuel. Well posted power men agree that whatever the fuel, the minimum is consumed for the power delivered.

The engines are made in several styles and range in size from 1 to 25-horse power. International local agents are able to supply catalogues and answer all inquiries. Anyone about to buy a power will do well to talk the matter up with the local International agent, with whom he is most likely acquainted. This will result in the selection of an engine combining highest efficiency with adaptability to needs.

The Sacramento Union maintains that the present hop situation is not justified by the crop of this year. The production is such that better prices should be paid than are now being offered.

Woodbury Business College

809 SOUTH HILL STREET, LOS ANGELES

Strong, original, practical, SUCCESSFUL. Belongs to no "chain" or trust, class or clan—absolute MERIT its only alliance. Concentrated, enthusiastic, COMPLETE. A school of FORCE, CHARACTER, and INFLUENCE. Prestige of long experience, thousands of graduates—every one a WOODBURY testimonial and a vital force in the world. "BETTERNESS" its distinctive quality. "THE SUCCESS OF THE STUDENT" its slogan. Entire year—begin when ready. POSITIONS SECURED. Write for "CATALOGUE W"—it is illustrated, interesting, instructive, INSPIRING.

The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine straight ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gauge depth to which moldboard should cut. It's a very desirable machine for road-building in city or village. It makes good roads and keeps them so. Although made of steel and malleable iron, still it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveling, Foundation-digging.

For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet, "Delightful Roads." It's free and tells you all about the 20th Century.

The White City Grader Company Box 26, White City Kansas

Jno. Schilling, Jr., Sales Agent, Davies Warehouse Co. Los Angeles

Spraying a Small Orchard

Requires a small spray pump—but a good one. You want just as good fruit as the owners of large orchards who use power sprayers—and you can have it. Any spray pump has done its part when it provides a high, even pressure, keeps the spraying material well stirred, gives no trouble, and works reasonably easy.

Bean's Little Giant Pump

does all this and more. When we say it "keeps the material well stirred" we mean it too, and it's important if you want good fruit. And the "no trouble" feature lets you feel good natured after the days spraying is over. The valves can't clog, the stuffing box can't leak (because there isn't any) and the pump is so simple it is a pleasure to use it. Of course we have good pumps cheaper but **Bean's Little Giant** is altogether the best barrel pump ever offered for spraying small acreage. Also a splendid white-washer

We have samples of these pumps in stock and will be pleased to show them to you.

The Effect of Nurse Crops on Alfalfa

Observations at University of Arizona as to Nurse Crops. They Hinder Development, Cause Slender Plants, and Lessen the Yield

ALTHOUGH nurse crops, especially wheat, barley and oats, are often sown with alfalfa, it is in recent years decreasing. It has been found that the young alfalfa does not usually need the protection afforded by a nurse crop and that it does not profit by dividing space, either above ground or below, with other plants.

In the fall of 1905, with a view to ascertaining the effects of nurse crops upon alfalfa under Southwestern conditions, the writer planted successive plats of alfalfa in pure culture, and with wheat, rye, barley and oats as nurse crops. Conditions of irrigation were identical, observations being made in March following, upon the well grown plants about three weeks before blooming.

Effect on Height of Plants and Stooling.

At this time the height of the plants in the pure culture was from 15 to 17 inches. In the nurse crop the alfalfa varied from 12 inches down, being generally not more than six or eight inches high. Near the edge of the pure culture plat the plants at this stage had generally two or three full grown stems, decreasing to as few as one or two in the middle of the plat. With the nurse crops, however, the alfalfa plants had but one stem.

The alfalfa plant also stools or throws out shoots from the crown, which in turn become other stems. The more vigorous the plant and the more room, light and food supply it has, the more numerous are these offshoots, as was observed on plants near the edge of the plat. In the middle of the plat the number of shoots was materially less. Plants having two full grown stems uniformly had considerably more shoots than those with one stem. Alfalfa plants in the nurse crop uniformly had few shoots, only a fraction as many in number as those on plants in pure culture. It follows in connection with these observations that the tendency of nurse crops is detrimental, due to the fact that the better the exposure of alfalfa to the external factors of growth, as food supply and light, the greater is the vigor of the plant.

Effect on Weights of Plants.

The weights of ten average alfalfa plants from various cultures were taken and found to be as follows:

From pure culture, ordinary stand.....	75.0grams
From pure culture, too thick.....	21.3 "
From rye, two-thirds stand.....	10.2 "
From wheat, one-half stand.....	12.5 "
From wheat, full stand.....	2.0 "

From these figures appears even more strikingly than before the injurious effect of a nurse crop on the development of young alfalfa. Further, it may be remarked that alfalfa which has been shaded by a nurse crop or otherwise, lacks in firmness of substance as compared with plants grown in pure culture and with full exposure to light.

Effect on Root Development.

Observations were made also on root development in the different plats. Here the differences

are more striking than above ground. Alfalfa roots in pure culture had, at the time of these observations, reached a depth of about 18 inches, whereas those grown with nurse crops had only in the thinner stands of such crops attained to a depth of twelve inches. Further, the same dif-

nurse crop plants used as intercultural in an adjoining rather thin stand of old alfalfa. The intercultural crops in old alfalfa were planted for about one-third of a stand. In the case of rye, there was no material difference in height between the pure culture, the nurse crop and the in-

Irrigated Alfalfa in Colusa County
Scene near Princeton

ferences in vigor of development were found under ground as above, for in general the roots of alfalfa plants grown with nurse crops were thin and spindling as compared with those grown in pure culture, and they were much less branched.

Cause of Ill-Effects of Nurse Crops.

Lack of food supply or water could not account for this difference between plants grown with or without nurse crops, for the land is naturally rich and was kept well irrigated. The injurious effects of the nurse crops must be attributed, to a considerable extent, to their shading the lower and slower growing young alfalfa plants. In fact, alfalfa plants grown with nurse crops have every appearance of suffering from insufficient light. The development of leaf expanse is greatly reduced, the internodes are abnormally lengthened, but decreased in number, the plant substance is soft and watery, showing insufficient elaboration of food material, and the root development is small.

Effect of Alfalfa on Nurse Crops.

Observations were also made as to the effect of alfalfa on nurse crops, and upon the different

terculture; but the rye planted as a nurse crop or as interculture would not tiller; and as a nurse crop it made somewhat slenderer stalks than it did in pure culture. The weights in grams of twenty-five representative stalks of each of the three plats were as follows:

	Rye	Wheat	Oats
	Grams	Grams	Grams
As pure culture.....	225	298	212
As nurse crop with alfalfa.....	122	165	161
As interculture in alfalfa.....	139	127	48

As remarked above, the cereals grown as nurse crops or intercultural did not tiller. They made only one stem from each seed. But rye growing in pure culture on the edge of the plat, where it had more light, stoolled abundantly; for instance, one ordinary stool having twenty-three stalks and another thirty-nine.

A Practical Test.

A practical comparison was made on a field scale between alfalfa planted with and without a nurse crop in the season of 1904-05. A piece of land was at that time stocked down to alfalfa, using oats as a nurse crop. Adjoining was a piece in pure culture. The difference in the develop-

Concluded on First Page

Coulson's Improved Mash Egg Food

Takes
Less
Feed

Makes
More
Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of COULSON'S NO. 3 CONDITION POWDER will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time they must have the best food you can give them from the commencement of the molt. You will find COULSON'S IMPROVED MASH EGG FOOD is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-Pound Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

COULSON'S IMPROVED MASH EGG FOOD is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Paspalum Grass a Native of America

The Pasture Grass Which Has Proved So Profitable in Australia Has Never Been Planted Extensively Here

Interesting Letters from PROF. WICKSON and A. F. WOODS of The Department

THE CULTIVATOR recently contained an article on Paspalum grass, which caused much comment and a number of growers from all over the State. The article was sent the Cultivator by a gentleman in Eastern Australia. In that section it is proving successful. In this country it has been tried with indifferent success. Prof. E. J. Wickson of the University of California writes regarding it:

Prof. Wickson's Letter.

"Concerning the Paspalum grass discussed in the clipping from the Cultivator. I can only say that it has been growing in California for a good many years at the Experiment Station, and to some extent in the hands of private growers. It seems to have made the greatest success at the Fulare Station, where it has manifested very notable drouth resistance, and a disposition to catch and hold in spite of heat and drouth. In the coast region north of San Francisco there are other grasses which are superior; for instance, the rye grasses seem to be better worth sowing here. There ought to be wider trial of the grass in this State, and we shall try to secure that. The motive of B. Harrison, whose writing you quote in the Cultivator, was manifestly to create a sale for the seed in this country, and he has succeeded notably in that effort, as I understand it. It is interesting to note that Mr. Harrison began his propaganda in this country by a letter to the San Francisco Examiner in July, 1906. The seed was, however, distributed in this State by our Station some years previous to that time, and did not seem to manifest wide enough value to justify pushing. As I say, however, we are likely to give it another trial distribution."

A similar query was addressed the Bureau of Plant Industry of the Department of Agriculture and the following is received from Acting-Chief A. F. Woods.

Mr. Wood's Letter.

"I will say that the grass is a native of this country, and is quite common in our southern states. It, however, has been growing under cultivation, but very little, and we are unable as yet to make any definite statement regarding its value as a cultivated grass. Our experience so far indicates that it cannot be grown in sections where severe frosts occur, as it winter kills very easily, and on this account would have to be sown every year. The cost of seed and difficulty in securing a stand of this grass makes this impracticable. There is very little danger of it becoming a serious pest like some of our aggressive grasses, as it does not possess the same general characteristics as does such grasses as Bermuda and John grass. I am taking pleasure in inclosing a copy of a circular, which we have prepared, and which I think will give you the information you desire."

The circular which Mr. Woods inclosed is as follows:

Paspalum Dilatatum.

"This grass is known also under the names of Large Water Grass, Golden Crown Grass, and Air-Flowered Paspalum. It is a smooth perennial, with a deep, strong root system, and grows in clumps or bunches 2 to 4 feet high. The leaves are numerous near the ground, but few on the

stems. Paspalum produces seed rather freely, but owing to the fact that it ripens from the tip downward and shatters off as soon as ripe, good viable seed can be gathered only by hand.

"Paspalum dilatatum is a native of South America and perhaps also of the Gulf States. At any rate it occurs apparently native from North Carolina to Florida and west to Texas.

Importance.

"In Australia, paspalum has proved to be a valuable grass. Agricultural writers claim that it has transformed the north coast of New South Wales into one of the most profitable dairy regions in the world. It is said to remain green when all other grasses are dried up, and several successive cuttings, aggregating 13 tons (green feed) per acre, were obtained at the Wollongar Experiment Station the season following the seeding. In the Tweed district paspalum pasture is said to support one dairy cow per acre the year round.

Cultivation in the United States.

No extensive cultivation of this grass in the United States has been attempted. In the Southern States, where it spreads naturally, some farmers have permanent meadows, or pastures consisting largely of this grass. Owing to its tendency to lodge, it is better adapted for pasture than for hay.

"Southern experimenters claim it to be one of the best winter pasture grasses for heavy, moist, black soils. It remains green all winter unless injured by severe frosts, and persistent grazing will not injure it. An immense number of leaves are produced, which are renewed more quickly after grazing than those of Bermuda grass, and under favorable conditions a paspalum pasture will last indefinitely. The character of the sod is improved by mixing redtop seed with the paspalum, as both grasses do well on the same class of soils, and

the latter is too bunchy to cover the ground evenly when planted alone.

Culture.

"Great care must be used in seeding paspalum to have the ground in the very best possible condition. The seed is very light; hence it is best to sow broadcast 5 to 10 pounds of hand-picked seed per acre. Sow on ground which has been thoroughly harrowed, and then roll or plank the seeds in.

"In the Southern States it is usually best to sow in October or November. If it is used for soiling or hay, it should be cut before the stalks become coarse, as the quality is much superior if the grass is cut when 18 to 24 inches high. By mixing the seed with that of redtop, Bermuda grass, and winter vetch the grazing capacity of the pasture is much increased, and the tussocky character of paspalum meadows is largely overcome. North of North Carolina and Arkansas this grass winterkills and should therefore not be planted.

"Under irrigation paspalum has proved to be an excellent forage grass in the San Joaquin Valley, California. Judging from the favorable experience, paspalum ought to be valuable as a dry-land grass in many parts of the southwest, where it should be fully tested. Farmers are cautioned, however, to test it first on a small scale, as the seed is expensive and the chances of success doubtful.

Seed.

Seed of paspalum is quite high priced and usually of low germination. The best hand-picked Australian seed rarely germinates over 50 per cent. and costs 40 to 60 cents a pound. In the Southern States the flowers are commonly affected with a black fungus, which seems to injure the seed. At any rate southern seed is very poor, often germinating only 5 to 10 per cent.

The Effect of Nurse Crops on Alfalfa

Continued from First Cover Page

ment of alfalfa in the two fields was so striking that an examination was made. That in pure culture was about 18 inches high, being of the usual height and development. That planted with the nurse crop was noticeably thinner on the ground, generally not more than eight inches high varying down to not more than two inches, and little developed generally. In the pure culture the roots extended downward to a depth of about two feet and sometimes deeper. The roots of alfalfa planted with oats generally extended down from two to six inches. It is evident that deep-rooted plants like those in pure culture can stand drought longer than can shallow-rooted plants, like those grown with nurse crops, even if all other conditions of vigor of growth are equal. Just these effects due to differences in root development showed themselves strikingly in the experimental plats later on. Through May and June a shortage of water, usual at this season of the year, was experienced, and these fields could not be irrigated until summer rains came in July. The second crop on the pure culture plat was cut about the first of June when about half-grown, in order to save the roots, the tops having begun to

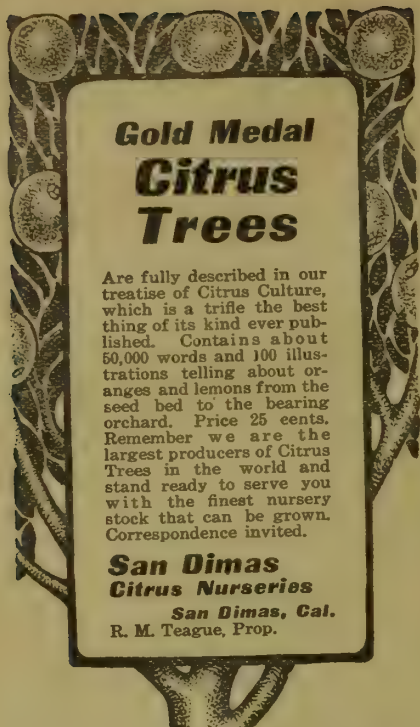

dry up. The alfalfa grown with the nurse crop had to be cut over earlier and twice in order to save the roots. When water was obtained the alfalfa in pure culture resumed growth and continued producing normally the rest of the season. The plats planted with nurse crops came on slowly, a fair cutting was not obtained until fall and a normal cutting not until the next season. In the meantime, during the drought the shallow-rooted plants had suffered more than the deep-rooted plants and save for prompt work in cutting, the stand would have been lost.

In Conclusion.

1. That the nurse crops hinder the development of tops and roots of alfalfa, especially when by reason of a thick stand or rank growth shading effects are excessive.

2. After the removal of the nurse crop the weakened and undeveloped alfalfa plants are poorly fitted to withstand drought and the stand may be lost.

3. In the average instance the loss in yield of alfalfa due to a nurse crop probably more than offsets extra return from the nurse crop itself.—V. A. Clark, of University of Arizona.

Gold Medal Citrus Trees

Are fully described in our treatise of Citrus Culture, which is a trifle the best thing of its kind ever published. Contains about 60,000 words and 100 illustrations telling about oranges and lemons from the seed bed to the bearing orchard. Price 25 cents. Remember we are the largest producers of Citrus Trees in the world and stand ready to serve you with the finest nursery stock that can be grown. Correspondence invited.

With the Citrus Growers

SOIL.

THERE is no more interesting subject than the origin of soils.

Geologists tell us that the soil we cultivate was one time in the form of gas. That was so far back that we will leave that stage of its evolution out of the discussion. We will take up its stage of transformation when it is in the form of solid rock. The soils of most of the orange groves of Southern California are from granite, and for this reason are naturally rich in plant food. This is so, because granite is composed of crystals of a large number of minerals that supply plant food. Feldspar is one part of granite that contains potash, soda and lime; sometimes but one of these elements are in abundance and sometimes two or more of them. The lime in the feldspar gives some phosphoric acid that we find in our soils.

Weathering.

The process of decomposition in our rocks is called weathering, because the weather is the most potent factor in their breeding up. Every time there is a change in temperature, there is a corresponding change in the size of the individual particles in the rock. Every one who has walked along a railroad track just as the sun is getting warm in the morning or in the cool of the evening, has noticed a creaking and slipping sound. Before sunrise there is always a space between the ends of the rails, while at midday during our hottest weather, the ends of the rails touch. This is due to the change in temperature and the position of the rails is changed twice each day. It is just so with the small individual particles of rock that go to make up the whole. The outside crystals of granite are subject to more sudden and a greater difference in temperature than are the inside crystals, and it is thus that the surface of rocks wears off and do not disintegrate uniformly throughout when exposed.

The mechanical force of freezing water that finds its way into the crevices of rocks is a powerful agency in decomposing the material, just as in the case of water pipes bursting when frozen.

The dissolving properties of carbonic acid gas constitutes a powerful and continually working agency for disintegrating rocks. This gas has an affinity for water and the rains collect it and it thus becomes applied to the rock whether buried or projecting above ground. Lichens grow in great abundance on all kinds of rocks and they have a powerful dissolving property. When once there is a layer of loose rock above the bedrock, other plants take root in it and the process of decay is much more rapid from then on.

The decomposition of plant life increases the amount of carbonic acid and thus the solvent agencies are greatly increased. There is nothing, so far as we know, that does not sooner or later succumb to the dissolving powers of this acid, and it is continually being formed by decaying vegetation and animal matter and the breathing process of animals. It is particularly active on lime formations, and caves in limestone countries are made through this agency.

Color.

Dark soils are almost universally

rich, due to humus in them. There are two exceptions to this rule, which are graphite soils and those darkened by the lower oxide of iron. This is due to poor drainage, the iron in the soil under such conditions uniting with other elements or bases, particularly phosphoric acid. This form of iron is the same as that which scales from iron at the blacksmith's forge.

Mahogany soils are always rich, the color being due to the humus and higher oxide of iron present. This form of iron is the same as iron rust, and is indicative of good drainage. That means that the plant food materials are not injured or rendered unavailable to any great extent.

Red soils may lack humus to a certain extent, but, as stated, the mineral plant food is largely in available condition, due to proper soil drainage conditions in ages past.

Yellow and white soils are almost universally poor, because they are leached soils. They have at one time been overlaid by peat or coal beds. The formation of these deposits was accompanied by much acidity which dissolved the plant food from them, leaving the white barren substance behind.

Clay Soils.

The purest clays are formed from potash feldspar, and this accounts for the richness of clays in potash. Clay is made up of potash, soda, alumina and silica. There is clay in all soils ranging from five per cent to 50 per cent. The heaviest clays come from clay stones, and clay loams come from clay sandstones. The purest clays are used in the manufacture of porcelain ware. Pipe, potter's and brick clays are less pure in the order named.

Feldspars.

As stated above, this combination of minerals is the chief source of potash, though some feldspars contain none while others are from 10 per cent to 20 per cent potash. They contain much silica and alumina which gives clay its character.

Silica.

There are two kinds of silica crystalline and non-crystalline. Quartz is an example of the first; jasper, flint and hornstone the latter. Crystalline silica is insoluble in water but the non-crystalline is soluble. This element is little used by plants except in making the framework, in the case of straws in grain. Bamboo takes up large quantities of silica forming the outer hard casing of the poles.

The last two named ingredients of soil are important inasmuch as they are in the case of the first, the chief source of fertility, and in the last make up the great bulk of most soils.

Lime Soils.

These are considered rich. They are friable soils and contain much phosphoric acid. Lime deposits are the result of immense collections of shells either in salt or fresh water and with these shells are often quantities of bone of water animals. From these is derived phosphoric acid in form of minute water animal known as diatoms. These divide and subdivide, shedding their shells like lids of little pill boxes, which sink to the bottom, and as the division is rapid and millions upon millions of them are at work

tinually; beds of these shells are formed in the bottoms of lakes, several feet and sometimes hundreds of feet thick.

Dolomite soils resemble lime soils, but they are mostly made up of magnesia and are, consequently, low in plant food.

Zeolites.

Zeolites are a combination of elements, among which are potash, lime, soda and alumina. They are susceptible to the action of acids and, therefore, are easily dissolved, and they also have a strong affinity for certain bases, and these two qualities make them very changeable. As a consequence, they act as a check on the rapid depletion of the soil.

Humus of Soils.

Humus is formed from the decomposition of organic matter, mostly vegetable matter, fungus and bacteria being active agencies in humus formation. Humus has a greater capacity for moisture than any of the soils, and for this reason soils containing much humus are retentive of moisture. Humus contains a large percentage of nitrogen and about 50 per cent of the available plant food of soils is found in the humus. The subsoils contain less humus than the surface soils, because less decomposed vegetation finds its way into the subsoil.

Hardpan.

Hardpan is caused, in most cases, in the central and northern part of the State, by the union of the lower oxide of iron with other minerals of the soil. In the "Hogwallow" lands this is the case; fine, small particles of soil in the form of globules are found and are known as bog-ore. Where ever this is found there is liable to be found hardpan. Alkali in excess forms hardpan where the rains are not sufficient to keep it moving in the soil. Regions in close proximity to lime deposits where the rainfall is not great will cause hardpan in the same way as alkali. The scant rains wash the mineral down to a certain depth and it collects there. Other seasons of light rainfall repeat the process till there is a collection near to the surface that forms a hard stratum. This may be seen along the Salt Lake road near Pedley.

SWEETNESS OF ORANGES.

While the following theory may not find general acceptance, it is given by a close observer of things scientific and is well worth considering by orange growers.

It is written by Leon Labonde, with the California Distilling Co.

I have been looking over the orchards in connection with the citrus null question which the California Distilling Company has under consideration, and I find a reason for want of sweetness in many of our California fruit. This, in my opinion, is due largely, if not wholly, to the indiscriminate planting side by side of oranges, lemons and pomelos.

During pollination the pollen of these trees is carried from one to the other indiscriminately by the bees, or other winged insects, causing the oranges to grow less sweet and the lemons less sour to the detriment of both.

I am inclined to think that many of the diseases of the citrus trees are likewise the results of unwise mixtures of fruits in the same orchards, and I am enquiring closely into this matter from the view point of the bacteriologist.—Leon Labonde.

FRUIT TREES EXHAUST SOIL.

"In considering the reasons why apple and other fruit trees do not bear as many or as fine apples as they did in the early days," writes Professor H. Garman of the Kentucky Experiment Station, "I have been impressed with the importance of supplying the trees with fertilizers as the soil becomes exhausted and am satisfied that the greater relative difficulty experienced nowadays, in keeping fruit trees in good condition is in part due to an exhaustion of the soil.

Trees forage more widely than smaller plants and may not show the effects of starvation as suddenly or as soon, but they must show it in time if grown long on the same land without anything being returned to the soil to replace materials removed by the trees. In this relation I was struck recently by a statement which I encountered in Professor Voorhees' interesting little book on fertilizers.

He says that twenty crops of apples of fifteen bushels per tree, and thirty-five trees to the acre, equal 1337 pounds of nitrogen, 310 pounds of phosphoric acid and 1805 pounds of potash. Twenty crops of wheat of fifteen bushels per acre equal 660 pounds of nitrogen, 211 pounds of phosphoric acid and 324 pounds of potash.

Therefore, according to Professor Vorhees, twenty crops of apples remove more than twice as much nitrogen, half as much again phosphoric acid, and nearly three times as much potash, as twenty crops of wheat. A good farmer would hardly think of growing twenty successive crops of wheat on the same land, no matter how good it might be, and it would seem to be still greater folly, according to the figures given, to attempt to grow twenty successive crops of apples, without returning anything to the soil."

LARGE LEMON PLANTING.

Amongst other liberal plantings of lemons this year will be that of the California Coast Lemon Co., in Ventura county. This company has bought a large tract of land of the large Santa Clara Rancho and as fast as first class lemon trees can be secured it will be planted.

F. K. Adams is its secretary and manager. Mr. Adams has wide experience with lemons and oranges, having been at the head, as manager, of the Pomona Fruit Exchange for years.

TO POISON SQUIRRELS.

The following, which appears in the Handford Journal, is said to be one of the best ever for killing squirrels:

One and a half ounces powdered strychnia, half ounce powdered cyanide of potassium, one pint of granulated sugar, one pint water. Directions: Dissolve sugar and strychnia in about two-thirds of the water (heating it to a boiling point, but be careful not to let it boil) and dissolve the cyanide of potassium in remainder of water. After heating it allow mixture to cool a little, and then mix. Put five gallons of clean barley in a tub and throw the mixture over it and stir thoroughly, and then put on a mixture of eight or ten drops of anise and stir again. Cover the tub and allow the mixture to stand for twenty-four or thirty hours.

KEEN KUTTER

Tool Cabinets

Everyone knows that to buy tools for any work, and be sure of satisfaction, all you have to do is to ask for Keen Kutter tools.

To save the trouble of collecting a useful set, and to provide a place for the proper care of fine tools, the Keen Kutter Tool Cabinets have been designed. Small and large assortments, every tool a Keen Kutter, every tool guaranteed.

The only tool cabinets made containing a set of guaranteed tools under one name and trademark. Made in different sizes and range in price from \$8.50 to \$85.00. If not at your dealer's, write us.

SIMMONS HARDWARE COMPANY (Inc.), St. Louis and New York, U.S.A.

MORE FRUIT WITH LESS LABOR

You can positively insure a larger crop, clean fruit and healthy trees at a saving of fully one-third the labor ordinarily required and with a much less outlay of time and money by using a Bean Magic Spray Pump. The reason is because it sprays thoroughly with high, even pressure, but the operator is working against only one-half the pressure indicated on the gauge. It's on account of the spring which makes the Magic Spray Pump the easiest running, most perfect spray pump ever made. No other pump can compete with it in the essential points of quality and durability, and we challenge comparison with all other makes regardless of price or construction.

Bean Magic Spray Pumps

are the result of careful study and experience in pump manufacture. We have no other line. We are specialists in pump-making, and the name BEAN on a spray pump or appliance is a guarantee that it is the best that money and brains can produce.

The most successful raisers of fancy fruit agree that spraying is the only and most effective method of securing the best results. The increase in profit from securing fancy fruit will alone soon pay for the outfit. Whether you have a large or small orchard you cannot afford to be without a Bean Magic Pump.

We have samples of these Pumps in stock, and will be pleased to show them to you.

Bean Spray & Pump Co.

For Gardening, plant Onions, Lettuce, Spinach, Turnips, Beets, Radish, Carrots, Cauliflower and Cabbage.

Sour and Sweet Orange Seed Bed Plants

The Finest Lot in California

My sour orange plants are grown from seed off the wild orange trees of Florida. Trees grown on this stock are very desirable for planting in heavy soils or lands that are subject to excessive moisture or drouth, also lands underlaid with clay or hardpan or poorly drained. Its most valuable feature is its resistance to gum disease.

My sweet orange plants are grown from seed off very large, old Tahiti seedling trees, thus making the very best foundation to grow an orange orchard on. Don't fail to see my stock before you buy, or address

William Wood, Box 118, Whittier, Cal.

When writing advertisers, mention Cultivator.

Wood Sole Boots and Shoes

We wish to call your attention to the fact that we have a large stock of Wood Sole Boots and Shoes of the very best quality. The Uppers are made of the very best quality Milwaukee Oil Grain. The Soles are well-shap'd and are an exact and comfortable fit, and our **Patented Fastening** makes this a **Waterproof Shoe**. We all know wood is a non-conductor, consequently it is much drier and a great deal warmer in Winter. They are lighter than Rubber or Leather Shoes and Boots, and will outlast half a dozen pair of either.

O.J. Weber Co. 555-557 S. Los Angeles St., Los Angeles, Cal.

Live Stock and Dairy

DAIRYING.

THE great dairy breeds of cattle were formed by poor men seeking to make the most of their farms. At first it was always by selecting the calf of the best cow and mating them with another "best cow's" calf that finally developed a type. This type showed the modification of food, climate and the taste of the owners. Man has ever his notions as to the colors of his domestic animals. The red color of the Shorthorn; the red of the Hereford; the solid color of the Jersey and the black and white of the Holstein are all man's fancy. All these breeds show other colors that are as good animals, but have been promptly suppressed as not according to rule. In the Shorthorn it took the breeders years to educate the judges of the show rings to admit that a roan or white was as worthy a prize as the solid red. The Herefords of Nevada outrank those of California by the high color of their hair. The Jersey breeders have come to accept the white on the cow, though there are still individual buyers that will not consider an animal of broken coloring as good. While the Holstein Breeders' Association flatly refuse to register an animal that is not black and white.

The five breeds of dairy cattle in use in the United States in numerical order are Jersey, Holstein, Ayrshire, Guernsey, with a herd or two of Belted Dutch and Brown Swiss. There are also some good herds of so-called dual classes, the Shorthorn and Red Polled. The Kerrys and Norman French cows are also in use in limited quantities, but are too few in number to be available for ordinary purchasers.

The Jerseys and Holsteins are the prevailing breeds in California in the greater portion of the interior. There are some good herds of Ayrshire on the Southern coast, and a few choice Guernseys owned individually. One or two small herds of Brown Swiss in Fresno county. I was naturally anxious to see this breed succeed here, but as the cattle were not in the hands of a breeder they have had little chance. It is always the old story of men thinking that any one can raise cows. Then why do they not? There is more money in fancy cows than in any other industry that a farmer can follow. Yet see the good blood constantly wasted in dairy cows! I have a neighbor that has a dairy and he told me the other day that he could not raise as good cows as he could buy. He had some of my registered cows' offspring purchased to head his young herd. I listen with sorrow, for it seems too bad that a man with a willingness to have good cows cannot educate his eye and have the imagination to see into the future, the unborn type he has pictured coming into actual form in his herd.

It is often asked at Farmers' Institutes how the breeds of registered cattle were formed. When a portion of the country had a few superior animals the first records were kept after the manner of the Arab horse breeders, by using the sire's name alone. Now if Tim Jones had an extra good milch cow

and her name was Kate, he perhaps called her son Jack. Every one in the neighborhood would know Tim Jones' cow Kate. They also would like to have every one know they owned cows that were daughters of Tim Jones' Kate's Jack. Shortly cows would be for sale that were Jack's get and would be sold as Molly by Tim Jones' Kate's Jack. Each generation having the sire's name held in combination until the name became burdensome when they would be written down and the cow's name shortened and a number added so that by referring to the list, the breeding was at once assured.

These records followed the great blood lines. When finally the men that kept these lists became overburdened by the work, they gathered together the men having cattle of the breeding represented and formed an association.

The fees paid for the printing and for the clerical work. When the official herd book was established, the first cattle that were recorded were sworn to be by the sons of certain cows, who were by certain sires, so that at least three generation of descent could be certainly identified by enough witnesses. After a lapse of a certain number of years the Herd Book was closed for new families and only animals whose parents were recorded were eligible for registration. It is needless to say that at first the anxiety to have as many animals in the Herd Book as possible led to some that were valueless as dairy animals being put in. These becoming heads of families. But soon within the Herd Book families, it was recognized that some families were greater or more potent in their transmission of dairy qualities than others. Their cash value rose rapidly above the rest, so that they soon became the leading sires and were purchased to head the less desirable strain until the warmer blood gradually predominated.

The invention of the Babcock did more to raise the standard of the dairy cow's production than any thing that had ever had come into her history. The churn test had been manipulated until it was not regarded as of value. The butter maker that could not add thirty or more per cent to the overrun in testing a cow was hardly up to his business. The Babcock test is accurate if the bottles are properly measured, or calibrated in the neck. They are readily measured by an one having a standard bottle to test them by.

The problem of sorting the sheep from the goats of the dairy cow was readily met by the association of dairy cattle establishing advance or official registration, on the production of the cow. The testing is to be done by an official sent from the Experiment Station of the State.

To meet the expense the association offers handsome cash prizes for the best records each year. These records are placed in a second herd book under a new number so that a cow has a blood number and a performance. This naturally makes the cow more valuable, as it has performed, or if it is at the head of the

Lost Strayed or Stolen—One Cow

That is about what happens each year for the man who owns five cows and does not use a Tubular cream separator. He loses in cream more than the price of a good cow. The more cows he owns the greater the loss. This is a fact on which Agricultural Colleges, Dairy Experts and the best Dairymen all agree, and so do you if you use a Tubular. If not, it's high time you

did. You can't afford to lose the price of one or more cows each year—there's no reason why you should. Get a Tubular and get more and better cream out of the milk; save time and labor and have warm sweet skimmed milk for the calves. Don't buy some cheap rattle-trap thing called a separator; that won't do any good. You need a real skimmer that does perfect work; skims clean, thick or thin, hot or cold; runs easy; simple in construction; easily understood. That's the Tubular and there is but one Tubular, the Sharples Tubular. Don't you want our little book "Business Dairymen," and our Catalog A. 200 both free? A postal will bring them.

herd, then his daughters have been
within the lines of production re-
quired.

Those that handle well-bred stock
know that it soon pays for itself,
for even if the first cost is relatively
high, the fact that the offspring is as
good or better than the parents un-
der reasonably good handling, is as-
sured. The tested cows are best of
all, for while an untested cow may
be fully as good as a tested one, no
one has found it out. Even in a
cow a good reputation is a fair es-
tate.

The result then, of breeding for
certain purposes, becomes fixed in
the type. The cow is governed by
habits that takes physical form.
Just as the people of Africa are
black and those of Europe are white.
The type is fixed so strongly that we
today do not believe that a white
man living in Africa would have the
pigment of black come under his
skin in an ordinary life time. We
know that the beef and dairy cow
differ in their physical makeup ma-
terial. In a few thousand years if
the conditions of dairy and beef
raising go on as they are doing now,
we will have two animals greatly
differentiated in their physical
makeup.

A dairy cow has the wedge-shape;
her backbone is rough with the ver-
tebra prominent. The neck is ewe-
shaped, the throat and breast clean
from extra fat. The face is femi-
nine with full eyes, large, loving and
kind. The muzzle and jaw are short
and strong. The ribs are set to al-
low a large stomach space. The
chest is broad enough to give heart
room and broad enough to have full
play for the lungs. The chest is not
as expansive as in the beef animal,
but large enough for free air spaces.

The bones of the hips stand out
prominently, the thigh is distinctly
incurved to allow udder space. The
hams are cat-shape. The rump
stands higher than the withers; the
tail is long and slender. On the
stomach are the long tortuous milk
veins; these can hardly be too long
or too crooked. The milk wells are
the opening where these veins leave
the body. Now the test of the value
or amount of blood flowing in these
veins can be made by compress with
the finger the flow at this opening.
If it is strong, the veins show it and
the heifer will make a fine cow.
Sometimes the largest flowing milk
veins do not carry as large an
amount of blood as others that are
more active.

The beef cow has a different meta-
bolism to her body; she builds the
fat on the outside and in through
the fibre of the muscles. The wide-
ly sought tenderloin and sirloin are
simply the great thigh muscles much
swelled with fat.—M. E. Sheman.

CARE AND TREATMENT OF A SICK ANIMAL.

Place the sick animal in a well dis-
infected, ventilated and dry box stall
with plenty of bedding and sunlight.
(Avoid draughts.) In cold weather
put a blanket on, feed sparingly of di-
gestible food, such as bran mash
made with linseed tea. Keep manger
sweet and clean. Water should be
pure and clean, and warmed when
necessary. It is always necessary
for new milch cows.

An injection of warm water per
rectum should be given all sick ani-
mals, excepting those afflicted with
looseness of the bowels.—By Dr. David
Roberts, Wisconsin State Veteri-
narian.

A PAYING FARM PROPOSITION.

One of the best paying farm proposi-
tions an ambitious man can take hold
of is cattle feeding either for market
or for milk.

Now that agricultural science has
given us an insight into the actual
principles which lie at the foundation
of the business, it is a mere matter of
applying them in daily practice to get
good profit for ourselves. Feeding
corn meal, or any combination of
feeds, won't necessarily make beef or
produce milk. Your steer or cow
has got to digest and use its ration or
the manure heap will be the richer
and you the poorer. In other words,
the simple act of feeding doesn't al-
ways produce results.

Here is where farm science comes
to the rescue. The new idea on feed-
ing tells us, first of all, that the steer
or cow is like a machine, and that the
feed each gets is raw material which
we wish to turn into flesh, fat or milk.
Now if your steer or cow, as machines,
don't work properly, a greater or less
percentage of your feed is bound to be
wasted. That is, animal digestion
must be absolutely right if the great-
est gain is to be made.

But it's impossible to keep the stom-
ach and intestines working right when
they are constantly forced beyond
natural limitations and that is what
every feeder of live stock is doing
when feeding for market or for milk.

From which it follows that anything
capable of continuing the digestive
function in healthy activity during the
weeks or months in which the fattening
process is going on, will solve the
problem to the feeder's satisfaction.

Experiment has proved conclusively
that a preparation containing true ton-
ic elements, blood builders and nitrates
(which are well known as cleansing
the system) is an actual necessity in
the cattle business. In fact, the great-
est success is impossible without it.
Just as well expect to preserve your
own health and stuff with rich food
for a period of months as to expect
your stall-fed steer or cow to do so.

The "food tonic" idea has come to
stay in the cattle feeding business—
success depends on it. Your animal
must be "toned up" and strengthened
by these mild elements which great
medical writers, like Professors Win-
slow, Quittman and Finley Dun, recom-
mend as beneficial. Give it to the
horses, it will make them fitter and
more salable. Lambs grow faster,
swine fat quicker—indeed all live
stock profit depends upon this tonic.

Some one has said that any one
can turn the handle of the separator.
While it may be true that any one
can turn the handle, it takes a smart
man to tell just how fast it should
be turned. Turning too slowly leaves
too much milk in the cream.

Profit in Lambs

A recent experiment in feeding lambs
proved that a small investment made
for Dr. Hess Stock Food returned the
feeder a profit of 25%. This was be-
cause the Hess-fed lambs were able to
digest a greater proportion of the
daily ration than other lots not simi-
larly treated. Dr. Hess Stock Food is
a tonic which makes perfect digestion
in any domestic animal. It contains
iron for the blood and nitrates to
cleanse the system of poisonous matter.

It is the prescription of Dr.
Hess (M. D., D. V. S.), himself
an authority on foods and
feeding.

DR HESS STOCK FOOD

shortens the time required to fit an
animal for market, increases the flow
of milk in dairy cows and keeps
farm teams in prime condition.
SOLD ON A WRITTEN
GUARANTEE.

California Horticulturally

OPENING OF THE DAVISVILLE FARM.

A VERY large Farmers' Institute, which practically introduced the new State farm to the farmers, was recently held in the new farm buildings at Davisville. The programme was a very excellent one and the sessions were well attended. The new farm is now in operation, the dairy department being the first to get under operation. The establishment of this farm is one of the best movements in an educational direction which has been made, for here the sons of our farmers and horticulturists can be instructed in practical and scientific agriculture and given a start in the best methods of work, with the reasons why the methods shown are the best. The separation of this branch from the Berkeley college is a good thing, too, as it removes the agricultural students from those who have been in the habit of sneering at them and surrounds them with their own class. It will also teach them practical work on the farm, and with over 700 acres of excellent land, abundant water for irrigation and all modern facilities for work there is no reason why the State farm should not turn out some of the best farmers in the country in the future.

PROTECTING TREE BUYERS.

Kings county has adopted an ordinance requiring a bond of \$5000 from outside nurserymen doing business in that county. Every county could pass a similar ordinance, and the result would be that all outside nurserymen would be practically prohibited from doing business in the State. The nursery business is both a legitimate and a beneficial one, and the outside nurseryman who sells us good stock is to be encouraged and not driven out. But, at the same time the purchaser of trees should be safeguarded. He should have some assurance that the trees which he buys will turn out as represented, and when he has spent several years of time and labor and been out a large amount in money he will discover, when he should reap the reward for his toil and outlay, that he has been swindled in the deal. There should be a sufficient bond required from all nurserymen doing business in this State to protect their customers who, to a large extent, are compelled to purchase on faith, and if the stock sold is not what is represented they should have some recourse. A State bond, one to be filed with the Secretary of State or with the State Commissioner of Horticulture, of sufficient amount to cover any possible contingency should be required, and it would not be burdensome on any respectable nursery, but if every county should require a bond it will become an unbearable burden and have the result of freezing out a legitimate and useful class of business.

GROWING INTEREST IN GRAPE CULTURE.

There is a strong and increasing interest being manifested in viticulture in the northern counties, and all through the Sacramento valley grapes are now the principal topic of interest among fruit men. This is probably due to the big profits which have been realized from vineyards during the past few years. Shipping grapes

are in the lead, and of these the Flame Tokay, Rose of Peru, Black Prince and Cornichon are favorites in the grape sections of Sacramento and San Joaquin counties. In Yuba and Sutter counties there is a great deal being done in Thompson's seedless. This has proved an excellent shipper and when once known is popular. It is a heavy and regular bearer, berries small, but clusters very large. It is a high flavored grape and, being seedless, is superior for cooking purposes. In all the country north of Stockton and south of Red Bluff there is a vast acreage being prepared for planting to grapes during the coming winter, and vines and cuttings are now in active demand and hard to get.

NORTHERN ORANGE SHIPMENTS.

There has been a big demand for oranges from Australia and, in order to take advantage of the market there offered, heavy shipments of oranges have been going forward from the northern citrus sections for some time past. Very much of the fruit which has been shipped would have been much better had it been left on the trees for another month, but the shippers claim that it is sweet and that it will color on the ocean voyage. Whether this be so or not, there is too much of an effort to take advantage of the early markets which results largely in discrediting our fruits abroad. This is not only true of citrus fruits, but of deciduous also. Very much immature and tasteless fruit is forced on the Eastern market, and as a result there are many people who decry California fruit, and the market is seriously injured thereby.

INTEREST IN EUCALYPTS.

There is a growing interest in the culture of eucalypts all over the State, and in Northern California especially, everything that relates to the growth of this valuable group of trees is sought with avidity. In view of this, we draw attention to a leaflet recently issued by the Forest Bureau of the Department of Agriculture, and which contains a great deal of valuable information concerning this tree. Any of our readers who are interested can procure this publication by addressing Gifford Pinchot, chief of the Forestry Bureau, Washington, D. C.

PREPARING FOR FRUIT GROWERS

The people of Marysville have taken up the work of the coming fruit growers' convention in good earnest. Arrangements have been made to hold the session in the Presbyterian church; the ladies' clubs of Marysville and Yuba city will arrange for entertainment of visitors. Free excursions will be given over the electric roads; a committee is now at work arranging for accommodations for all who attend, and nothing will be left undone to make the convention a pleasant as well as a profitable one.

AN EXPLODED THEORY.

The Vegetable Garden

TOMATO BLIGHT.

A LARGE number of tomato growers met at Whittier last week upon invitation of Prof. Ralph E. Smith of the State University force.

Prof. Smith has experimented largely with Bordeaux mixture and made a showing of its effectiveness which was surprising.

A news report of the experiment says:—

The practical demonstration at the State University pathological laboratory in Whittier seems to have settled the question in the minds of over 200 growers assembled from all the tomato growing belts.

The laboratory garden spoke for itself in terms so certain that none who viewed the tomato vines could entertain skepticism. The tomato patch consists of one-half acre, set about fifty varieties of plants. Professor Smith experimented with Bordeaux mixture, making the application with a sprayer immediately following each rain, and at the time when plants were wilting all over the country. The sprayed plants are in evidence today, thrifty and firm, while those in the same patch, not sprayed, met disaster at the blight's onslaught. The tomatoes on the sprayed plants are perfectly preserved and free from blight indications, even at this late day in the year.

The demonstration answers the question, "Does it pay to spray?" affirmatively under ordinary conditions.

Professor Smith finds that 200 gallons of the mixture will spray one acre of vines.

The cost of the mixture is from \$2 to \$3 per acre, the average being \$2.50. Eight to ten acres may be sprayed a day by three men, a team and an ordinary power pump spray with no nozzles. Figure the labor cost at \$10 per day. The mixture and labor will approximate \$4 per acre. It is further estimated that two applications will meet the requirements.

In this section last year the average price for shippers was \$40 per ton, which about three tons were taken from an acre. The average cost of growers was \$8 per ton, of which four tons were taken from the acre. This approximates \$150 per acre.

Equally as good returns were warranted this year until the blight appeared,

which caused the loss of at least \$100,000 to 500 acres of plants. At \$12 per acre, the spraying would have cost \$6000.

Conditions are not the same each year, but the point in using Bordeaux mixture seems to be merely a matter of insurance. With fair market conditions the cost of insurance seems to warrant the cash outlay.

The same treatment is equally effective for potato blight.

From Bulletin No. 175, by Ralph E. Smith of the Agricultural Experiment Station the following is taken:

"Winter blight" is a disease caused by the potato-blight fungus, which, under favorable conditions, has seriously affected winter tomatoes in Southern California. The same trouble was observed on potatoes in Sacramento County in the fall of 1904 and spring of 1905, and in the coast region of Monterey county, but is not very prevalent in California. This fungus causes a spotting of green and ripe tomatoes, dark spots on the stems and branches, and complete and sudden ruin of the crop. It occurs only after heavy rains or very heavy fogs and dews, and consequently affects only the winter crop of tomatoes. Such plantings should be sprayed heavily with Bordeaux mixture after every rain to prevent the development of this form of blight.

The formula is as follows:—

Bluestone 5 lbs.

Quicklime 5 lbs.

Water 50 gals.

Dissolve the bluestone and slake the lime in part of the water in separate barrels. Dilute the two and mix, or rather, pour the two solutions into the water, stirring constantly to prevent precipitation. Use at once.

LOB INGIR FIG.

Samson, the Maywood Colony nurseryman, is pushing as usual the famous Lob Ingir Smyrna fig. Many growers of Sacramento valley have found it successful and are recommending it. Regarding it Mr. Samson says:

The Lob Ingir fig excels all other figs for drying purposes, and people planting Smyrna figs should insist on getting this variety. The following description of the Lob Ingir is given in Bulletin No. 9, pages 250 and 278: "Lob Ingir Bulletin, Smyrna; Commercial Smyrna; (California;) Erbegli; Erbelli; Erbeili. Fruit large to very large, about two and three-fourths inches wide by two and one half inches long, decidedly flattened like an onion, being compressed in diameter of stem to eye. Neck thin, distinct but short; generally straight. No stalk, or one very short. Ribs heavy, uneven, knotted and branching. Eye large with numerous scales of amber tint, open and about three-sixteenths of an inch wide, so that the pulp can be seen through the opening. Skin the color of beeswax, smooth and waxy, shaded greenish. Pulp, pale to dark dark amber; when unripe, shaded red. Tree a strong, spreading, but rather straggling grower, with heavy branches. This fig is the best type of Smyrna, and the majority of figs imported from Smyrna to this country belong to this variety.

WORK UP YOUR OWN LUMBER.

With the ever increasing price made by the lumber trust, the proposition made by the De Loach Mill Mfg. Co. of Bridgeport, Ala., on another page, is very attractive to one who has a little standing timber of his own. A portable mill at a reasonable price can be built which will saw from 1750 to 7000 feet per day. There are thousands of these mills now in use and giving satisfaction. They should appeal to California.

Leaky roofs have a cause. How can you get rid of it?

Lay Gen-as'-co Ready Roofing, and you do away with both cause and leak.

The cause of leaky tin is rust; of leaky shingles, warp and rot; of leaky coal-tar roofings, drying-out of oils, which leaves them to crack and crumble.

Gen-as'-co has the life and permanent waterproofing qualities of Trinidad Lake Asphalt sealed in it so that they will not escape. Gen-as'-co does not rust, rot, dry-out; and can't leak.

Write for practical Book 35 and samples.

Go to any progressive dealer and insist on Gen-as'-co Ready Roofing.

The Ornamental Garden

LIPPIA.

LIPPIA repens is proving a fine
plant for lawn purposes on hill-
sides or where the fine care re-
quired by blue grass or white clover
cannot be given. Blue grass makes
the most beautiful lawns to be seen,
but takes work, water and intelligent
care as does no other feature of the
place. Lippia gives no such beauti-
ful, velvety appearance and cannot
be compared to such a lawn.

But put the Lippia up against the
neglected, weed-infested, joint-grass
over-run lawn, and we prefer the
Lippia every time. On a heavy slope
in a not too prominent place, and
when water is not plentiful, it is a
most desirable plant. It makes a
dense mat and bears numerous tiny
flowers an inch or so above the
ground.

Its culture is very simple. The
plants may be bought in flats at rea-
sonable prices, but it has been so
generally introduced all over the
State that it is easily secured for the
digging. The writer recently wished
some and found where a residence
was being moved and that great
quantities might be had for the ask-
ing. It had been given no water this
year and was so thankful that every
little rootlet was so appreciative for
the care and water given when
transplanted that it proceeded to
grow and prosper at once. Even the
cuttings many of them made roots
and whole plot will soon be a mass
of green.

TIN CAN CLUB.

An organization has been formed
at Monterey called the Tin Can
Club. In a circular issued the club
says: Every one of you start a nur-
sery in which to grow trees and
plants; a corner in your yard is the
thing.

To city and town folks: Each one
of you grow at least one tree.

To farm people, young and old:
Make it your business to plant useful
trees in every possible place. If you
have boys or girls get them inter-
ested.

They can gather nuts and seed of
good trees and grow them for sale.
Madrona, laurel, oak and redwood
trees, two years old, rooted in cans,
will bring good prices.

Rescue all the tin cans you come
across and take them home.

Punch holes in their bottoms and
fill with sandy loam. Select some
protected place near to a water sup-
ply and bury the cans to their tops.

Now plant in the cans acorns,
rooted seedlings or cuttings of use-
ful trees, also some table nuts and
maybe other seeds.

Hard seeds may be made to sprout
quickly by pressing them into a
layer of wet earth in a box, then
cover over with about a foot of new
horse manure.

When sprouted, plant them in
cans.

Should the cans not be well rusted
out before the time for setting out
the trees in their permanent resting
places, put a little salt about the out-
side of the cans.

All things that live require careful
attention while young, and by using
cans in the propagation of trees you
can nurse them until old enough to
plant in the open without danger of
their dying.

RESETTING PLANTS.

The critical period in the life of a
plant is when it is transplanted from
the nursery to its permanent loca-
tion. In moving trees from the nur-
sery a portion of the root area is
lost, and the top should be reduced
in proportion to the loss of root area,
in order that the newly transplanted
and unestablished plant may be able
to secure sufficient moisture and food
to supply the demands of the top.
The roots should also be pruned, so
as to protect them against decay by
cutting away all broken and muti-
lated parts, leaving the cut surfaces
smooth and in such position that
they will come in contact with the
fresh earth. After the plant becomes
established certain branches will
grow more rapidly than others and
the appearance of the plant will be
spoiled by this unequal growth.
Pruning should, therefore, be resorted
to in order to preserve a symmetrical
development of the plant without
rendering it artificial or formal in
appearance. Care should also be ex-
ercised during the early development
of a plant to maintain a uniform dis-
tribution of branches around the
central axis, if it be a tree, so as to
insure a symmetrical and pleasing
form at maturity.

At planting time the excavation
prepared for the reception of the
tree should be of sufficient depth to
allow it to be set as deep as it stood
in the nursery and large enough to
accommodate the roots without bend-
ing them, while the earth in the bot-
tom of the hole should be loosened
at least one spade length below the
general floor of the hole. In replac-
ing the soil over the roots of the
plant, a thin layer of earth should be
placed immediately in contact with the
roots and thoroughly pressed down by
trampling in order to bring the par-
ticles of soil in close contact with
the feeding roots of the plant. The
hole should then be filled and the
surface left slightly above the gen-
eral surface of the surrounding
ground.

MAINTENANCE OF A GREEN- SWARD.

Newly established lawns should
never be allowed to mature seed.
Frequent clipping with the lawn-
mower, if not made too close, tends
to stimulate the stooling of the
plants rather than to interfere with
their growth. If the lawn is located
in a dry section or one subject to
long periods of drought, it will be
necessary to irrigate or sprinkle. A
little water is an injury rather than
a benefit. If watering is begun it
should be done at night rather than
during the day, and sufficient water
given so thoroughly wet the soil.
During the winter the new lawn
should have a dressing of coarse lit-
ter, or, if the soil is poor, of thor-
oughly composted stable manure. If
neither of these is available or de-
sirable, a fall dressing of bone meal
will be found very useful. In the
spring the lawn should be raked with
a steel-tooth rake, all breaks care-
fully filled in with turf or seeded,
and the whole area rolled with a
heavy roller. Subsequent treatment
will consist in maintaining the
moisture by proper use of water and
frequent clipping with the lawn
mower.

Oroville will hold no citrus fair
this year.

LILLY'S BEST NORTHERN GROWN SEEDS

Are tested and proved best
for the West—all other sorts
being discarded. Why experi-
ment, why take chances?
You can absolutely depend on
LILLY'S seeds. Our catalogue
for 1908, consisting of 112
pages, 16 colored pages made
from actual photographs,
with full cultural directions,
is yours for the asking. You'll
also find that LILLY'S seeds are

WALNUT GROWING.

Walnut growing in the upper country is increasing in popularity, and many inquiries are being made as to suitable soil, climate and conditions. Many people think that the walnut will not grow out of a very limited area along the ocean front, or within a few miles of the sea, where the climate is modified by the sea breezes; and that it is very exacting in the matter of climate. This is an error, for this nut will thrive over a wide range of longitude, and gives good results very far north. In fact, we derive our varieties from England and France, where they sometimes have to withstand a zero temperature. At the same time, the walnut is very susceptible to a low temperature when it is followed by a warm day. The walnut will bear a freezing temperature if it is continuous, but not a freeze followed by a bright sunny morning. In such a case, the trees get sunburned and killed, the damage being due rather to the sun than the frost. The walnut is a deep rooting tree and requires a deep soil, an alluvium preferably, for best results. As to varieties, the Franquette is the best for northern sections, or such places as are subject to late frosts. It is a late bloomer, and is more liable to escape than the earlier blossoming

varieties. Luther Burbank and some other prominent growers advise that in planting the walnut, several wild walnut seeds should be set in the locations where the permanent tree is desired. These will start, and several smaller trees should be allowed to grow for a year or two and then all but the strongest should be removed; this should be cared for until it is four years old and then grafted with the desired variety. As a result of this method, a more hardy tree is obtained and one that will last for all time. Californians, however, are impatient for results and as no returns can be hoped for from this method for twelve to fourteen years, it is not likely to become popular. In fact, under good conditions, trees procured from the nursery should begin to bear four years from planting and will yield from eight to ten crops before the others have begun to bear, and it would be cheaper to set out nursery trees and buy the other orchard when it is ready to bear, with the money. One could do this and have a tidy balance left.

BEST OF THE WEST.

I am well pleased with the Cultivator, and could not do without it very well. It is the best farm paper for the farmer of the West that I have had so far.—Walter Hart, Kingsburg.

IS THIS NOT CRIMINAL WASTE?

At Seattle, Wash., a carload of strawberries was recently dumped into the bay by a commission firm. The berries were not dumped because they were unsalable, but simply because the market was well supplied with fruit, and this carload was disposed of in this way to relieve the market. To have tried to sell this fruit would have broken the price, the dealers claim, and so the berries were wasted.

Now, we can understand how dealers and growers desire to keep prices up to a profitable level; this is commendable, and it frequently occurs that to remove a carload of fruit from the regular market will prevent a depression of prices. But it seems criminal to remove the fruit from the market by destroying it in this way. We confess to having a feeling of aversion against destruction of any kind of food for man or beast; it always seems criminal to us to burn corn for fuel, as has been done so many times in the middle west, although this was often done when other fuel was not obtainable.

There is something wrong with our system when it will be found profitable to absolutely destroy food products. These strawberries could have been removed from the market very effectively by canning or preserving them—and they would have eventually served as food for human beings, instead of becoming food for fishes.

We do not advocate the practice of trying to sell fruit on a glutted market, but instead of absolutely destroying it, the fruit should be preserved in some form, so that it can be used when the fresh fruit is off the market. These strawberries would have found a ready sale in any of our markets next winter, for it is more than likely that the supply of canned fruits will be short. When we consider the dearth of canned fruits in our own cellar this season, it pains us more than ever to learn of this destruction in Seattle. Let the surplus fruit be canned, rather than destroyed.—Fruit

ANNUAL CONVENTION.

The sixth annual convention of the National Nut Growers' Association was held according to announcement and was a most enjoyable and profitable meeting to all in attendance. The deliberative work was important and carries forward lines perviously adopted and provides for the enlargement of the influence and usefulness of the body.

The next convention goes to Chattanooga, Tenn., on a date to be fixed by the executive committee, which will permit nuts of all kinds to be exhibited to the best advantage.

The Golden Orange Association of Redlands says that if possible to secure white men they will not employ Japs for picking oranges this season. C. M. Brown, an orange packer of Redlands, estimates the orange output of this year will be slightly less

LET US EXPLAIN

to you the difference between the **PURE BRED FRANQUETTE WALNUT**—as shown on the border of this Ad—and the ordinary English walnut. When you buy walnut trees, **BE POSITIVE WHAT YOU ARE GETTING.** Guessing is uncertain and often expensive.

Our walnuts for seed purposes and our scions for grafting purposes are all secured from Mrs. E. M. Vrooman's famous **GRAFTED FRANQUETTE WALNUT** grove of Santa Rosa, California. Her grove contains

ONE THOUSAND TREES---ALL GRAFTED

the only large bearing **FRANQUETTE** grove of "ALL GRAFTED TREES" in the world. Write for our **FREE BOOKLET** describing this "King of Walnut Groves" and its record.

When you buy trees that are descendants of this grove you make no mistake. We guarantee our trees to be Pure Franquettes.

We cannot tell you much in this small space, but let us write you direct. The Pacific slope—(generally speaking)—is adapted to Walnut culture and is destined to become the center of this profitable branch of horticulture. Why not start now? Address,

MANY INSTITUTES THIS MONTH.

The Department of University Extension in Agriculture of the University of California announces Farmers' Institutes to be held on December third and fourth at the Salvation Army Colony of Fort Romie, near Soledad, in Monterey county; on December tenth and eleventh at Elk Grove, Sacramento county; on December twelfth and thirteenth at the Christian Colony, near Acampo, in San Joaquin county; on December fourteenth at French Camp, San Joaquin county; on December seventeenth and eighteenth at Ripon, San Joaquin county, and on December nineteenth and twentieth at Ceres, Stanislaus county.

Farmers' Institutes will also be held in Southern California, under the direction of Mr. J. B. Neff, Conductor of Farmers' Institutes in Southern California, as follows: On December second at Banning, Riverside county; on December third and fourth at Coachella, Riverside county; on December fifth at Brawley, Imperial county; on December sixth and seventh at El Centro, Imperial county; on December tenth and eleventh at San Jacinto, Riverside county; on December twelfth and thirteenth at Elsinore, Riverside county.

The Geological Survey has demonstrated that all the subterranean waters of 775 square miles in Southern California are connected, and that every well taps a common supply; and on this is the water-plane, which was twenty-three feet below the surface of the soil in 1898, is now fifty feet below. People can live beyond their means in respect to water, as well as timber, oil, natural gas, fish and game.

ANOTHER WARNING.

Hon. Gifford Pinchot, Forester for the United States government, has just completed a tour of ten thousand miles, several hundred of which was in California.

In a report made to the agricultural department he sounds a note of warning which ought to be taken seriously and acted upon promptly. He states emphatically and without hesitation, that in twenty years the timber supply on the government reservations will be exhausted, as well as private holdings, and unless prompt measures are taken to replace these reserves the country will be without timber.

In sounding this warning Mr. Pinchot urges, as he urged before the National Irrigation Congress at Sacramento, that the danger of the situation be not underestimated. He avers, and statistics bear him out in his averment, that the United States uses more timber than any other country on the globe and, when the timber is exhausted, we shall face a famine which will effect every man, woman and child in the United States. It will be remembered that President Roosevelt made this declaration in his speech on this subject.

The matter is up to Congress. This winter the Forest Service will petition Congress to appropriate a greater sum of money in order that a campaign may be made of along the line of reforestation timber lands. Mr. Pinchot says, however, that it is utterly beyond the possibility of the service to meet the situation and prevent serious trouble. One hope entertained is the Appalachian forest, and an effort will be made to protect this and promote growth there. A scheme will be advocated that will be watched with a great deal of interest. It is to give power to State Forestry Departments to protect watersheds and prevent private owners from devastating these lands in such a manner as will injure lands below. If this plan works well the Government Forester believes it will be taken up generally and will aid greatly the plans for protection of natural resources.

It is to be hoped that Congress will look into this subject carefully, and act promptly, so that the country will gradually be brought back where the timber famine now so nearly upon us may be averted or put farther into the future.

FARM PRODUCTS OUR SAFEGUARD.

The richest farming region in the world forms an impregnable barrier against any threatening wave of financial disaster in this country.

The boundless resources of the West, pulsating through their railroad arteries, are the surest possible bulwark against trouble. This is the unalterable belief of farseeing railroad presidents and the managers of their traffic departments.

The value of the leading cereals and other produce of the American farmer this year is \$324,000,000 more than it was a year ago.

With an unprecedentedly prosperous year in his immediate wake and a banner one directly before him the American farmer today is the richest and most independent personality in history.

While the national government will not estimate fully the value of the crops until December 1, preliminary deductions, usually more conservative, indicate clearly the enormous worth of the farm products.

It is this estimated value of crops based on the amount of shipments the railroads are handling, the shortage of cars, the value of the cotton crop in the South, the tremendous value of the corn and wheat crops in the North and West, the value of fruit and vegetables in California, and the booming conditions generally throughout the West that causes a general feeling of optimism on the part of those in touch with the financial situation.

The action of the New York banks in refusing to pay cash on demands drawn upon them by western correspondents, emphasizes the necessity for more direct connection between the banks of the West and the national treasury. We of the Pacific Coast must be independent of New York and Wall street operators. Were this the case we would scarcely realize the present money stringency.

Shop Talk

CLUBBING OFFERS.—The CULTIVATOR receives requests for clubbing rates with other publications. Previously it has not been our policy to take up this matter on account of our traveling agents; but now we are in a position to make you prices that will save you money on almost any list you may send us.

Many of our readers, no doubt, contemplate soon placing an order for magazines for 1908, and we make this suggestion that you send us the list of what you want, letting us price same with your renewal to the Cultivator. This is also another opportunity to subscribe to the CULTIVATOR for friends, as any or all can go to different addresses, and it gives you the benefit of quite a reduction in prices. If you should not care to wait until we can return you the price, you can safely trust us to make the order and credit your subscription at the very best rate.

Great care must be used in writing orders to write plainly and give full Postoffice address, as errors are sure to cause long delay.

Do not forget our CHRISTMAS OFFER of last week, and that all new paid subscriptions received between now and the first of the year get the CULTIVATOR UNTIL JANUARY 1, 1909.

As stated last week, for each new name you send, your subscription will be credited three months.

Order blank you will find on another page; fill it out. It is an easy and satisfactory way to make a few Christmas presents and at the same time paying on your own subscription.

THE PROHIBITION WAVE.

There is something singular about the wave of prohibition which is sweeping over the country, especially through the Southern States. It appears like the great sweep of an ocean billow, which, starting in a moderate swell, gains volume until its force is irresistible, and it breaks on the shore in tremendous detonations of thunder.

The veterans of the Civil War will remember back forty-two years, when they were unbidden guests of the South, that to talk prohibition in Georgia or Alabama, or even in Kentucky, would have engendered hostility almost as bitter as to advocate negro emancipation, or negro suffrage today. We did not dream of such a thing as a temperance wave going over the South in our lifetime, for we supposed the people were too firmly fixed in their notions of liberality along convivial lines to accept the views of prohibition enthusiasts.

Discussing this phase reform with a Southerner recently, he gave as one reason why the rural districts of the South have gone dry, the inefficiency of labor, which he said has been largely due to intemperance. So exasperated have the planters become at the indolence and shiftlessness of hired help, which they charge to drink that they determined to expel whisky and all intoxicants from southern soil. It does not appear to be so much of a campaign of morals as a campaign of self-protection on the part of the planters.

We shall not be surprised to see the same condition prevail all over the country. Liquor is the curse of the labor problem in every agricultural district. Throughout the Middle West it is especially so, and the time is coming when the farmers there will unite solidly for prohibition. It will be a relentless fight against "booze" and an eternal farewell to all the troubles which it creates.

Speed the day! Liquor is, and always was, the bane of the wage-earner. Not all, of course, but the great majority. Naturally the employers' interests have suffered correspondingly with the laborer and his family, and it will be a halcyon day for every one on the farm when liquor is banished from its domain.

The planters of the South are in the saddle to fight whisky and its allied cohorts. Soon they will have every agricultural State in the north and west, also in the contest, and from that day we shall begin to see happier hours on the American farm.

Agricultural Notes of the Pacific Coast

Northern California

Vallejo is having a pumpkin festival.

Hop prospects are said to be slightly better.

The Colusa Sun appeals for giving the farm a name.

Ripe Loganberries are on the market at Santa Rosa.

The date of the Petaluma poultry show is December 18th to 21st.

Auburn will have a large increased planting of table grapes this year.

Forty sacks to the acre is the yield of rice now being harvested at Willows.

Anderson claims that Happy valley strawberries are the finest in the State.

Alfalfa seed is almost as good as good as gold this year, and very scarce.

Prune growers about Anderson have a bonanza in their prune crop this year.

Cigars are being manufactured from tobacco grown on a ranch near Marysville.

An inventor near Dixon has manufactured a stump puller said to be very practical.

One olive grove near Redding will market twenty thousand gallons of olives this year.

The money stringency has caused cessation of work on the central canal at Willows.

"The best attended institute ever held in Grass Valley," is claimed for the recent institute.

Colusa has a pump with a ten-inch discharge which will irrigate twenty acres of alfalfa per day.

Australian rye grass is proving very acceptable pasturage at Chico, it is also being baled for hay.

Hamilton City sugar factory finished the season with fifty-two thousand and seventy-five sacks output.

Red Bluff is losing a large number of valuable horses from some strange disease which has not yet been named.

The drainage canal which has been under construction for the California Investment Company at Colusa has been completed.

Sacramento Valley Development Association is urging that the Rivers and Harbors Convention meet in California next year.

The recent rains were not sufficient to wet down the mountains to prevent forest fires. A big fire occurred back of Guerneville last week.

Application has been made to the Department of Agriculture to have a thorough examination made of the peat soils in Sacramento and Yolo counties.

Prof. Malley, an entomologist from South Africa, is here to secure parasites for the codling moth, and to investigate the methods of handling pests by parasites.

Rural papers in many parts of the State are maintaining that the special session of the Legislature is in the interest of bankers and large commercial institutions rather than the farming class.

Central California

Dinuba will have a Chrysanthemum fête this week.

Exeter's premium "punkin" weighs ninety-two pounds.

Turlock growers are realizing \$50 per ton for late grapes.

It now costs \$100 for the boxes to contain a carload of raisins.

Total shipments of Emperors from Exeter were forty-seven cars.

Exeter grapes were all gathered prior to the 15th of this month.

About fifteen hundred cars have been shipped from Pajaro valley.

There are seventeen thousand acres of vineyard in Tulare county.

"Orange picking is now in full blast and the crop is fine," says the Lindsay Gazette.

Fresno county is still working along the line of having a citrus fair early in January.

Lindsay's total shipments of oranges this year is one hundred and ninety cars.

There are eighty-three thousand orange trees planted in the neighborhood of Dinuba.

Hanford is manufacturing a new pump on the centrifugal plan which is said to be a wonder.

A large increased percentage of grapes will be planted the coming season in Fresno county.

C. K. Decker of Hanford has a hundred and four stands of bees which netted him \$4.50 per stand.

Exeter district will ship five hundred cars of oranges this year as against four hundred last year.

Various county entomologists are issuing bulletins giving formula for Bordeaux mixture, or peach blight.

The wineries are practically all closed in Fresno county and the last of the table grapes are now being shipped.

The Farmers' Institute at Wasco last week was well attended. Sugar beets was the principal topic of discussion.

The national forest reserves in California now exceed thirty-six thousand square miles, or one-fifth the acreage of the State.

Notwithstanding financial conditions the raisin market is holding up remarkably strong and the growers are generally holding for full price.

Complaint has been issued against the Spreckles Sugar Company because of dumping chemicals in the Salinas river, which killed the fish.

Turlock shipped one hundred and fifty-nine carloads of produce during the month of September. Potatoes and hay were the principal shipments.

President Roosevelt has signed the proclamation creating the San Benito National Reserve. It will contain about one hundred and forty thousand acres.

The meeting of the farmers of the Turlock irrigation district resulted in the formation of the Central California Produce Company. Directors for the coming year are: L. A. Walker, Claus Johnson, D. J. Wood, M. Bothun, H. S. Bengston, A. T. Carr and Frank McVey. These gentlemen are to be directors for the ensuing year.

Southern California

The Salton Sea has fallen three feet since last June.

Redlands has a factory for the manufacture of pulp boxes.

Imperial Standard says this is the longest alfalfa season ever.

There are hundred-pound bunches of dates on the trees near Mecca.

Four cars of celery were shipped from Paularino, Orange county, last week.

A walnut grower at Whittier has evolved a machine for gathering walnuts.

Anaheim Fruit Association shipped its first shipment of oranges last week.

A slight touch of frost visited the lower sections of Southern California last week.

Nearly three hundred cars of celery have been shipped from the southern part of the State.

Imperial valley hog raisers are somewhat disconcerted over the serious decline of pork.

Coachella is urging the necessity of a pre-cooling plant for the benefit of the cantaloupe shippers.

San Jacinto olive growers have begun picking olives which are commanding \$40 to \$80 per ton.

One machine thrashed for the Pietra ranch, near Ventura, fifty-six thousand sacks of lima beans.

San Fernando is investigating the control of storm waters which have heretofore done much damage.

El Centro ranchers are longing for the introduction of someone to love; in other words, the cry is for women.

The Submarine claims that Coachella valley will be in the market with over two hundred cars of early onions.

Government Expert Woglum is down to business in Orange county experimenting with cyanide fumigation process.

The Chase Company of Riverside has planted a large acreage of oranges near Mecca, which for two years have done well.

Some threshing of lima beans which was done too soon after the recent rains has given a low quality of beans, which are now being redried.

Oranges are remarkably mature in Southern California. More so, in fact, than ordinarily. Nearly all sections have shipped Thanksgiving fruit.

There are seven packing houses in the little town of Highlands all busy putting up oranges. Besides, at East Highlands, near by, there are five more.

The Arlington Heights Fruit Company will plant a ton of poppy and sweet pea seed on the street frontage of its great property of Arlington Heights.

The new directors of the Thermal Cantaloupe Union are: L. D. Mallory, C. W. Mexter, J. A. Gordon, Geo. M. Beach, J. W. Newman, J. H. Magaw and E. C. Gammill.

Celery growers of Southern California are pleased at the cooler weather, as the nipping frost of the lowlands has killed the fungus which was injuring the celery greatly.

The Coast

Butter is now quoted in Portland, Oregon, at twenty-five cents.

Shipping of prunes is now the leading industry in the Willamette valley.

Northern Colorado beet sugar plants are paying out over \$5,000,000 to growers.

One hundred sheep men met in annual session at the Dales, Oregon, November 12th.

Dayton, Washington, has laid off its force of apple pickers because of shortage of cars.

Sheep growers near Roseburg, Oregon, are offering \$40 per head for every coyote killed.

Apples are produced in Albany, Oregon, on a tree said to be over fifty-two years old.

There was less canning of fruit done in Oregon this year because of higher price of grain fruit.

A canal which will supply water to thirty-five thousand acres is under contract for Bend, Oregon.

The stockmen's association of Oregon is protesting and demanding more equitable grazing privileges.

Fruit growers at Montesano, Washington, are forming a protective association with a capital stock of \$4000.

The largest prune-packing plant in Oregon, at Albany, has been forced to close down on account of the financial situation.

An exhibition of Willamette valley apples made at Portland has attracted a great deal of attention and is said to be one of the finest ever made.

WON SOME PREMIUMS.

W. S. Sullivan, the Buff Orpington specialist, made the following winnings at the recent San Jose show:

1, 3 and 4 pen; 1, 2 and 3 cock; 2, 3, 4 and 5 cockerel; 1, 2, 3, 4 and 5 hen; 2, 3, 4 and 5 pullet. C. B. Carrington cup for best display of Buff Orpingtons; National S. C. B. O. Club Silver Cup for best display of breed by members, two Association and six Club Special Ribbons.

Buff Orpingtons were third largest class in numbers in the show. Mr. Sullivan's address is Agnews.

AT ELECTRICAL SHOW.

At the electrical exhibit to be held in Chicago January 13-25, will be one of exceptional interest to farmers. It is made by the Stromberg-Carlson Co. They are the telephone people who make a specialty of farmers' telephone lines, and an instructive showing will be made.

Any interested farmer who will write the firm at Chicago will secure valuable booklets on, "How to Organize," "How to Build," and other valuable information as to telephones.

Above all, any one visiting Chicago should see this great exhibit.

A face is a sensitive article. If you don't believe it, watch old Flintsoil wince when his wife twits him about that wart on his nose. It hurts him to hear his face spoken lightly of. Still in spite of this sensitiveness there are those who put laundry soap on their faces, and not content with that, take a brush and rub it in. Trouble follows of course. A man can't use a boot-jack for an eye-stone without inconvenience. Williams' Shaving Soap is the proper thing for shaving. Its use will bring comfort, health and pleasure.

"By sending a 2c stamp to the manufacturers, The J. B. Williams Co., Glastonbury, Conn., to pay postage, you can obtain a free sample."

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledge standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Flicher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

ALESBURY DUCKS.

At the State Fair held at Sacramento last month, the writer saw some of the finest Alesbury ducks that it has been our privilege of seeing for a long time. We often wonder why these ducks are not more popular in this country, especially when a speciality is made of raising ducklings for market.

Economic Qualities.

For market purposes perhaps the Alesbury outranks any of the domestic breeds of ducks, for the reason of its rapid growth and early maturity. Ducklings have been produced ready for market in from seven to nine weeks of age and weighing from four to five and one-half pounds. In fact, if sold as ducklings, they should be marketed by the time they are nine weeks old, for over this age they begin to get their adult plumage.

They have a small bone, yet carry a heavy amount of creamy-white flesh which is well placed on the breast. They are good layers, often making an average of 150 eggs per duck per year, and begin laying early in the fall. They very rarely set and are not much depended upon for this purpose in England, their native land.

History.

We quote from Edward Brown's work, "Races of Domestic Poultry:"

Some of the older writers upon poultry termed this race White English, but in the early part of the last century the name Alesbury was given, doubtless due to the fact that duck breeding was extensively practiced in the vale of Alesbury, in Buckinghamshire. . . . The White Alesburys are beautiful and ornamental, matching well in color with the Embden geese. . . . Since that time the name has been universally adopted. The breed has proven one of the most valuable for early maturity, which explains its popularity, not only in this country, but elsewhere, whilst it has always had a strong clientele among exhibitors. About thirty years ago the appearances were that the race was losing both size and vigor, probably owing to the fact that nearly everyone obtained their stock birds from Buckinghamshire, and that in that country inbreeding was almost universal. Since that time the injury thus done has been overcome, for which we may thank an out-cross of Pekin blood, which has restored the virility of the Alesbury. At the same time much is owing to these birds being bred in many parts of the country, and thus the choice of stock is greatly increased. Mere change of conditions is in itself often beneficial.

Description.

In appearance the Alesbury is boat-shaped, in that the line of the body is level with the ground the legs being placed about midway between the breast and stem. One of the characteristics is the delicate color of the bill and legs, the former being pink or flesh like. It has been claimed that this delicate color can only be produced in the vale of Alesbury. However, we know that some

of the best specimens we ever saw had bills that were not of this delicate color; being of the opinion that these ducks had foreign blood in their make-up, we asked if such was the case, but were informed that such was not the case, but that even in the imported specimens the color would change. Undoubtedly, it can not be maintained on strong soils.

The standard color of the plumage of the Alesbury is pure white; bill pale flesh color, free from black or dark marks. Shanks and toes. Bright, light orange. Weight: Drake nine pounds; duck, eight pounds.

The only difference between the male and female, is that the former have two or three curled feathers in the tail.

For breeding stock it is important that the bones of the leg should be stout without being heavy. In fact, one of the great features of the Alesbury is their light bones. At the same time they must be sufficient to indicate vigor.

AROUND THE YARDS.

Start this fall with a trio or pen of thoroughbreds.

Straw or leaves serves best for the scratching shed.

Your hens should be through the molt now and started to lay.

Select the hens that lay nice, large, even-shaped eggs. They will please your customers better.

The most attractive poultry house ever designed will add nothing to your profits. What the fowls need is a house free from drafts, dry, comfortable and convenient.

Some poultrymen put poultry wetting over the dropping boards to keep the birds from scratching in the droppings; this saves work when cleaning out the houses.

The fair summer boarder was having a look over the farm.

"What are those queer looking birds?" she asked.

"Them's geese," answered the farmer.

"Oh, yes!" exclaimed the fair one. "And do they lay all the gooseberries you use?"

House for Fifty.

Please inform me through the columns of your valuable paper how large a chicken house should be built for fifty Buff Orpingtons, and the best method for ventilating same; also state how large the run should be.

Please state where I can get full information in regard to raising frogs for market.—J. H.

A house to accommodate fifty fowls, will depend somewhat upon conditions and climate. In California it is not necessary to have nearly so much room as in the Northern and Eastern States. Mr. Curtis, of Altadena, a very successful poultryman, has forty-five White Leghorns in each yard, which is 20x140 feet. His houses, which we consider large enough for the number of fowls, are 8x16 feet.

Orpingtons are larger than Leghorns, yet we believe that a house

LILLY'S BEST SCRATCH FOOD

A perfectly balanced mixed grain feed strengthened with beef scraps, granulated bone, charcoal, grit and shell. It is rich in all the elements necessary to make hens lay and feathers grow. Practical poultrymen praise it highly.

8x16 feet is large enough for fifty Orpingtons.

The best method of ventilating in this county is an open front house, with a burlap curtain to let down on rainy nights. Many are using this style of house with good success.

We do not know where you can get the information you desire in regard to raising frogs.

RAISING THOROUGHbred POULTRY.

The following essay is one which was entered for competition in the prize contest inaugurated by the Iron Mountain Poultry Train and contains much of interest:

One of the most important industries in which the American people of today are concerned is one which is being mostly sadly neglected, one which, if given the careful attention it justly deserves, could be made the most profitable as well. I say neglected, because it does not receive the diligent care it should; and profitable, because it brings the greatest amount of income on the amount of capital invested. This industry, as you perhaps have already divined, is the raising of thoroughbred poultry.

I deem it hardly necessary here to say that this class of stock deserves more attention than the farmers generally give it. There are, indeed, few farm yards untenanted by fowls of some kind, and few homesteads without a poultry house. It is rare, however, to meet with an instance where the breeding and management of poultry is conducted with the care and intelligence so frequently bestowed on other kinds of live stock.

Now, if poultry is kept at all, whether for pleasure or profit, it is surely worth while to use rational means for securing the object in view. To have good poultry it is necessary to provide a dry, warm, well-ventilated house for them. Cleanliness and freedom from moisture must be secured if the greatest success is to be attained. Constant and careful attention is absolutely indispensable. It is a lamentable fact that a great many of the farmers permit their poultry to roost in trees or any place else it suits them, and then insist that poultry raising is not profitable. It never seems to enter their minds that if poultry is to be made profitable it must be housed properly, fed properly and attention be given to their wants—the three great stepping stones which lead to success.

To obtain the best results in this enterprise I would urge poultry raisers to select a standard breed of a recognized strain and breed them exclusively. Make a speciality of this one breed, then give all your time and surplus money to the raising of the best of this breed. What could be more pleasing to the eye than a flock of chickens of one breed? Uniform in color, all of a size and all of one pure breed. Aside from their beauty, they are the most profitable as well. The market and poultry dealer will always give a few cents more per pound for a coop of uniform poultry where their dressing qualities are about equal. I am sure a coop containing one breed will always attract the eye of the buyer.

Another great aid in making this industry pay—in fact, the cardinal principle in profitable poultry raising—is extensive advertising, for without it, anything in the way of pre-eminence cannot be established. You must let the people know what you have, and an excellent means of

50 Cent Eggs

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pall, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pall or sack freight prepaid by us.

accomplishing this is through the columns of good poultry journals and farm papers.

Poultry breeding is rapidly becoming a science, an art (if it is not already,) which is beginning to command the respect of the cultured and refined in all walks of life. The day for hap-hazard breeding is fast passing and should be. Now is the time to begin the reformation if you have been careless with your fowls. There has been a great awakening along this line.

The Missouri Pacific Railway Poultry Exhibit Train, which recently visited this city, created quite an interest, and the farmers are taking up the raising of thoroughbreds with renewed energy and zeal. May the day speedily come when thoroughbreds may be found in every farm yard, and then, and not until then, will the farmers be awakened to a due appreciation of the wonderful possibilities now neglected; not until then will this important enterprise have received the consideration it so justly merits.—Rural World.

STRONG FERTILE EGGS.

These depend a great deal on the amount of animal food the stock birds obtain. Just now there is nothing better than fresh cut bone in this line. Eight pounds of it will feed thirty-six fowls for a week and is all the animal food they need, so that a quarter of a dollar spent in this way will repay itself time and again in the extra eggs produced. Not only this, but such eggs will be the best possible for hatching purposes.—American Poultry Advocate.

Be economical. True economy avoids all waste and extravagance, and applies money to the best advantage. A Savings Account is an aid to economy. The complete facilities of this Bank are at your service. Four per cent interest on Deposits.

MAKING VINEGAR.

VINEGAR is made from a number of different products. The best quality is made from fruit juices; cheaper grades are made from the malt, grains and sugar refinery wastes and other sources. The cheaper kinds are often colored and otherwise "doctored" and then sold as cider vinegar. In order to prevent this fraudulent practice a number of States have passed laws establishing certain standards for vinegar. These laws are not entirely uniform. The minimum legal amount of acetic acid for cider vinegar is placed at four per cent in some States, in others four and one-half per cent and still others five per cent. The total solids likewise required vary in different States from one and one-half to two per cent.

Changes in Vinegar Production.

There are two important changes which take place in the conversion of fruit juice into vinegar. First, the sugar in the juice is converted into alcohol, and secondly, the alcohol is converted into acetic acid. In these transformations 100 parts of sugar in the juice should produce theoretically about 51 parts of alcohol; that is, one should obtain about half as much alcohol by weight as there was sugar in the juice. In practice, only from 45 to 47 per cent is actually obtained. In the conversion of alcohol into acetic acid 100 parts of alcohol should yield theoretically 130 parts of acetic acid, but less than 120 parts are actually obtained. Starting, therefore, with 100 parts of sugar in the fresh apple juice, under favorable conditions we should obtain from 50 to 55 parts of acetic acid. To make vinegar, therefore, which shall contain five per cent of acetic acid it will be necessary to have fruit juices containing at least ten per cent of sugar. For four and one-half per cent vinegar, apple juice analyzing at least eight and one-half per cent of sugar will be necessary.

Acetic Fermentation.

After alcoholic fermentation is completed another group of micro-organisms attack the alcohol and convert it into acetic acid. The acet-

ic fermentation takes place much more slowly than the alcoholic, requiring 18 months to two or three years before all the alcohol is changed into acetic acid when the cider is kept in ordinary cellar storage. The most satisfactory results at the New York State Station at of acetic fermentation were obtained temperature of 65 to 76 degrees F. When the micro-organisms causing acetic-acid fermentation were introduced into the cider at that station in the form of vinegar or "mother" after the alcoholic fermentation had been completed, the conversion of the cider into vinegar was much more rapid than where no addition of vinegar was made.

In a cool cellar, cider that had thus been inoculated by the addition of cider vinegar or "mother" reached marketable condition a year sooner than where the vinegar was not added. Vinegar should never be added to cider that has not completed its alcoholic fermentations, since the presence of the acetic-acid greatly retards alcoholic fermentation. On this point Browne, of the Pennsylvania Station, states as follows:

"Many farmers and vinegar manufacturers make a foolish practice of adding fresh apple juice to old vinegar stock in the hope of thus securing a more rapid conversion of the product into vinegar and then complain that their vinegar 'won't make.' The sugar of the juice must first undergo the alcoholic fermentation before the acetic fermentation can begin, and by adding apple juice to old vinegar the alcoholic fermentation may not only be checked, but even absolutely prevented."

The organisms causing acetic fermentation require abundance of air in order to do their best work. The practice, therefore, of inserting an empty bottle in the bung hole of a barrel intended for vinegar is useless and injurious, as it prevents the free entrance of air, (which is necessary for the growth of the acetic micro-organism). After acetic fermentation is completed the organisms are no longer needed. Barrels containing vinegar should then be filled full and tightly bunged, otherwise these

organisms or others of a like nature may attack and destroy the acetic acid already formed, rendering the vinegar weaker or entirely worthless. At the New York Station some of the uncorked vinegar finally actually became alkaline.

Suggestions for Making Vinegar.

The foregoing facts relative to the alcoholic and acetic fermentation lead to the following practical suggestions on vinegar making: Use only ripe, sound fruit. If the fruit is dirty, it should be washed, otherwise there is danger of introducing micro-organisms into the juice that will interfere with normal alcoholic and acetic fermentation. For the same reason cleanliness should also be observed in grinding and pressing the fruit and in the handling of the juice.

When possible, the pressed juice should be placed in some large receptacle and allowed to stand for a few days before putting into barrels.

In this way considerable solid matter held in suspension will settle before the liquid is placed in casks. The casks should be well cleaned, thoroughly treated with live steam of boiling water, and should not be over two-thirds or three-fourths filled with apple juice. The bung should be left out, but a loose plug of cotton may be placed in the hole to decrease evaporation and prevent dirt falling in. The bung should be left out until four and five-tenths to five per cent of acetic acid has formed.

When fresh cider is placed in barrels and stored in ordinary cellars, alcoholic fermentation is not completed until the end of about six months. With a cellar temperature of 60 to 70 degrees F. this item can be considerably reduced. If yeast is added to the fresh cider, fermentation can be compelled in three months or less. If compressed yeast is used about one cake to each five gallons of juice should be used after first thoroughly softening the yeast with lukewarm water.

When the acetic fermentation has gone far enough to produce four and five-tenths to five per per cent of acetic acid, then the barrels should be made as full as possible and tightly corked in order to prevent destructive fermentation of acetic acid and consequent deterioration of the vinegar.

Vinegar From Prunes.

Vinegar was made at the Oregon Station from undersized and otherwise unsalable prunes. The prunes were first washed and then run through a homemade machine with spike rollers, which lacerated and tore them. The pulpy mass was then inoculated with a pure culture of yeast (*Saccharomyces cerevisiae*.) This caused a strong and rapid fermentation, which broke down the cell walls of the prunes, thus liberating the clear juice, which flowed into a receptacle below the vat. This method of securing the clear liquid was inexpensive and very satisfactory. A little more than three gallons of juice was secured per bushel of fruit. The juice was fermented in open barrels. Fermentation was completed in ten days, when the juice was found to contain ten per cent of alcohol. It was then inoculated with a pure culture of vinegar ferment (*Bacillus pasteurianus*) by floating it on the surface of the liquid by means of pieces of cork weighted so as to bring the culture in contact with the liquid.

The vinegar thus produced was of excellent quality, with a fruity flavor and good body, and contained 6.89 per cent of acetic acid. The only objection to it was its color, which was that of very dark wine. It was, however, but little darker than imported malt vinegars, which find ready sale in Oregon markets. But the use of yeast for the alcoholic fermentation and the addition of vinegar "starter" after the acetic-acid fermentation, pear vinegar containing 8.89 per cent acetic acid and apple vinegar containing six per cent have been made at the station within four months from the time the fruit was pressed.

The barrels must be free from must and mold, the depth of the liquid should not exceed the surface measures, free air must be continually admitted, an even, warm temperature should be maintained and, last, but not least, the fruit that is used should be free from decay and mold. —Portland Oregonian.

City Friend.—Do you keep a cow?

Mr. Outlotz (of Drearyhurst)—I have a strong suspicion that I do. What I have to pay my milkman every week certainly ought to keep two or three cows.—Chicago Tri-

ANTIOAK LEATHER

Is manufactured by a chemical tanning process, the exclusive property of this company. **It is Superior to any other** and is produced as cheaply as any other leather. The method retains all the desirable qualities of the hide and destroys the undesirable; the result—a perfect leather.

Harness Made of Antioak Leather

quality and **GIVES THE GREATEST VALUE FOR THE MONEY.** The trade must have Antioak Leather.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Roselle.

Several queries have come regarding the interesting plant roselle, hibiscus or jelly plant, which should have far wider cultivation in California. One wishes to know how to sow the seed, when to pick for jelly, etc.

The seed is being destroyed this year by mildew. Plants in the garden of the writer were practically destroyed before noticed by the mildew, during the October rains. They should have been sprayed with the formula recommended in the Cultivator last week, page 499, or possibly with Bordeaux. To save the seed when the mildew has not destroyed the pods, allow to ripen till seeds are hard and black, then pick pod and all, or let the seed rattle out in a cup.

In the ten years which the writer has grown it, this is the first it has been destroyed by the mildew. So between the early cutworms and late mildew no seed will be saved.

To make jelly, cut before the seeds are ripe; cut pods in two; place all in kettle; nearly cover with water; boil, strain juice; boil, add sugar and treat as for any other jelly; place in cups. For sauce, use calyx only; add sugar and treat as any other fruit.

Possibly Grubs.

I have a two-year-old Jersey heifer which will be fresh in six or eight weeks. She has coughed some the past week or two and small bunches have come up along her back about as large as walnuts, and one at the point of shoulders as large as the palm of ones hand. They seem to be quite sore. They resemble grub bunches.—C. J. S.

Cut into one of the lumps and see if it is grubs. These are treated by enlarging the breathing opening with a wooden splinter and putting on the grub with a medicine dropper, a couple of drops of kerosene oil, or carbolic acid or of turpentine. If these prove to be merely grubs then the cough may be dismissed as a cold. Cover her with a blanket at night and see that she is not out in the wet. Pneumonia is one of the fatal cow diseases of California. If the bunches are not grubs, then after she freshens have her tuberculin tested. If she re-acts dry her off and fatten for beef before the disease progresses further.—M. E. S.

Bordeaux.

Is this a good time to spray peach trees and prune them? Give Bordeaux mixture? Is this a good time to spray for curl leaf?—A. M. M., Redlands.

For blight this is the time. See last issue. For curl leaf wait till nearly time to leaf out in the spring. The 5-5:50 is the usual Bordeaux mixture. Five pounds of sulphate of copper; five pounds of lime; 50 gallons of water. Slake lime and dissolve copper separately. Strain and pour together into the water. Do not pour one into the other, but pour simultaneously into the larger vessel, stirring constantly.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Eating the Fence.

What causes horses to gnaw fer boards, or rather, eat them up? What is the remedy? Would lime or sheep dip placed upon the fence keep them from the habit?—E. F. Modesto.

The trouble seems to be caused constant green feed. It is common in horses and colts on pasture. As is a natural craving, we indulge it, hauling into the fields or corrals few wagon loads of brush from the fruit trees and vines. Not having these, try common willow brush, the small limbs rather than heavy wood. On the fence they are now troubling cover the boards with crude oil, that having the asphaltum base, the best thing we have found. Lin washes they like even better than the plain boards.

Coal Ashes.

I would like to ask whether coal ashes would be beneficial or harmful to a lemon orchard; also ash from pine wood?—C. L. G., San Diego.

The coal ashes would not be harmful on most soils. If of heavy compact nature, they would be beneficial in putting the soil in better mechanical condition. Without any question wood ashes of any kind are beneficial.

Mushroom Culture.

Will you kindly inform me how to make beds for raising mushrooms? are there different varieties; if so, what are they?—Subscriber.

There are different varieties, all of which are named and instructions given as to culture, in a bulletin issued by the Department of Agriculture, Washington, D. C. It can be had for the asking.

Keeping Cider.

How can I keep cider. Have tried boiling and cooking, but it will ferment and spoil.—M.

To preserve flavor it should not be boiled. Full instructions were in the Cultivator a few weeks since.

Heat to 165 degrees; allow to stand a few days in glass to settle. Rack off, heat again, keeping at 165 or 170 for a half hour; bottle and seal as you would canned fruit.

Ripe Sorghum.

Will you please tell me through the Cultivator, if I can safely feed ripe sorghum, (well seeded) to a cow?—Subscriber, Turlock.

Certainly, if you begin a little at a time and gradually come up to full feeds. I have fed it for roughage for whole winters at a time.—M. E. S.

Dactylis—Olive Oil.

Enclosed you will please find some seeds and blades of grass. Kindly let me know what kind it is, if possible, as it seems to be very hardy and I would like to buy some of the seed and give it a trial here. Also what is the recipe for making olive oil?—A Subscriber.

This grass was submitted to Dr. A. Davidson who names the grass Dactylis glomerata, or orchard grass, or sometimes cock's foot.

Bailey's Cyclopedia says of it

The Largest and Finest Stock of Furniture in the West

Dining Room Furniture

For the Festal Thanksgiving Day

The coming of Thanksgiving always brings with it the memories of the many family reunions and the enjoyable dinners. This is the one day of the year that the dining-room should be at its best.

"One of the best known and most useful of grasses. Useful for lawns under trees." That is under Eastern conditions. Here it is of no great value.

The manufacture of olive oil would require so extensive a description that it would be impossible to give comprehensive instructions in this department. To get a general idea, a mill where it is manufactured should be visited. And if its manufacture is to be attempted its process should be mastered, for it is a delicate product and requires experience. In a word, it consists of crushing pressing, placing in receptacle to settle after which it's "racked off." Later it is filtered, clarified and placed in cans, all of which requires several months.

Plants on Overflowed Land.

Can you tell me through your paper if there are any trees or grasses

that will grow on low land that is partially covered with water during the wet season? You will say first, drain the land, etc., but this cannot be done. I have three-fourths of an acre on the front part of my place, which is little less than an eyesore, and I would like to cover it up with some trees or shrubbery, even if I received no benefit from it. The land is light and mellow and much resembles an ash heap and is covered in the spring and early summer with foxtail grass.—E. R. J.

This was submitted to Mr. Neff, who says that all that occurs to him is rushes, papyrus or tules or willows.

Will any subscriber who has experience give us a list of plants which will do well under these conditions.

HERE COMES THE DOLLAR.

The Cultivator has been coming to me for some time and I do not see how I can get along without it, so here comes your dollar.—P. F. Nice, Brawley.

The Fruit Growers Meet

Next Tuesday State Horticultural Commissioner Jeffrey will call to order the Thirty-third California Fruit Growers' Convention.

This will be the first under the new commissioner and will be the occasion of many meeting Mr. Jeffrey for the first time.

It goes without saying that John Isaac, who has been the efficient secretary for so many years will also be at the secretary's desk. The program, which is just received, is as follows:

Tuesday morning, December 3, the gavel will fall at 9:30, when, after the usual invocation, welcome by Mayor Hall of Marysville, with addresses by Governor Gillett, Commissioner Jeffrey. Edward Berwick will speak on Parcels Post and Prof. Clarke on University Extension.

Tuesday afternoon there will be: Apple Growing in the Willamette Valley, M. O. Lownsdale; Pear Growing in California Under Present Conditions, Prof. R. E. Smith; Pear Blight and Its Control, Howard Reed; California Orchard Diseases, Prof. M. B. Waite; Smyrna Fig for Profit in the Interior Valleys, Geo. C. Roeding; The Fig in the Sacramento Valley, W. Herbert Samson. Tuesday evening the Woman's Civic Improvement Clubs of Marysville and of Yuba City will tender a reception.

Wednesday morning will be devoted to fruit-growers and labor, as follows: Fine Art of Breeding, David Starr Jordan; Labor in the Rural Industries of California, John P. Irish; The Pacific Coast Labor Question from the Standpoint of a Horticulturist, G. H. Hecks; Discrimination Between City and Country in Taxation, A. N. Judd; The College and the People, Prof. Leroy Anderson.

Wednesday afternoon Transportation and Marketing will hold the boards.

R. D. Stephens of Transportation Committee will report; Report of Fruit Distributors by Alden Anderson; Report of Committee on Prunes, J. L. Bowers; Common Interests of Fruit Growers, Paul Shoup; Marketing Citrus Fruits, B. A. Woodford; Canadian Northwest as a Market, F. W. Cranfall.

Thursday morning, Entomological session.

Something we need, Prof. Vernon L. Kellogg; Practical Work in Combating the White Fly, E. K. Carnes; Present Status of Parasitism, E. M.

Ehrhorn; Fumigation and Scale Insects, Los Angeles Inspectors; What the Fruit Growers Expect from the Nurserymen, H. P. Stabler.

Thursday afternoon, Excursion over electric lines of the Northern Electric Company.

Thursday evening, "Value of 'Cover Crops,'" James Mills.

Friday morning, Horticultural Promotion.

Electric Roads for Developing Fruit Growing, H. A. Butters; Importance of the Careful Handling of Fruit, J. H. Reed; The National Farmers' Congress and Its Work, J. A. Filcher; Improvement of Inland Waterways, A. R. Sprague; Commercial Value of Ornamental Trees, C. B. Messenger; Nut Cultivation in California, Leonard Coates; Relation Between Fruit Growers and Canners, Isidor Jacobs.

The closing session on Friday will be on Viticulture.

Report of Committee on Roads, A. R. Sprague; The Reciprocal Influence of Stock and Scion in Grafted Vines, Prof. Frederic T. Bioletti; Progress of Viticultural Work in California, Prof. Geo. C. Husmann; Grapes, Mrs. M. E. Sherman; Interdependence of the Pacific Coast, Dr. Clarence E. Edwards; Beets and Sugar in California, J. A. Hamilton.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

Where the Door Opens Constantly

FINE OL' COUNTRY.

Fine ol' country
We got here.
Fair at any
Time of year.
Blossoms noddin'
On the vine,
Green hills lookin'
Mighty fine.
Violets peepin'
Up at you
From their dew-drenched
Beds of blue.
Ain't a thing that's
Out o' gear,—
Fine ol' country
We got here.

Fine ol' country
We got here;
Gettin' better
Every year.
Eastern folks all
Read about
Our grand climate,
Then come out;
Come out here an'
Look around;
Swear that Par-
Adise is found,
An' that heaven
Seems right near,—
Fine ol' country
We got here.

Fine ol' country—
Best of all
On this ol' ter-
Restrial ball.
Blossom-spangled,
Bloom-embowered,
Sun-kissed, balmy,
Gayly flowered.
Mountains decked
In nature's green;
Grandest climate
Ever seen.
That folks love it
Isn't it queer,—
Fine ol' country
We got here!

—Sunset Magazine.

THE PEARL NECKLACE.

IT WAS about half past four in the afternoon, of a cold and crisp December day, when a large automobile stopped in front of one of the most famous jewelry establishments in Rue de la Paix. A distinguished looking gentleman, wearing a costly fur-lined coat, evidently about 60 or 65 years old, alighted and entered the shop.

The proprietor immediately thought him a customer of enough importance to wait on him himself, and the gentleman did not waste much time in getting down to business.

"Now the thing is this," he said, "I have a niece of whom I am very fond, and who is going to be married in a few days. I should like to give her a valuable present. Please show me some pearl necklaces, but I do not want any of the ordinary affairs, though it is, of course, rather superfluous to tell you that, as I know you do not carry any such things in stock."

He said this with a smile, and the jeweler bows, greatly flattered.

"You understand, then," the customer continues, "I want the most beautiful necklace you have. I do not know exactly what such a thing costs, but if you have something that pleases me I am willing to spend, say about 200,000 francs."

The jeweler opened his eyes wide—it is not every day that he has a chance to sell necklaces for 10,000 Louisd'ors.

Leaving his customer alone for a minute, he returns with a half dozen boxes, which he places in front of him on the cloth covered table.

The customer examines all the necklaces carefully. Then he asks about the prices, which are all in

the neighborhood of the amount mentioned by him. He stands undecided for a moment, and then says:

"I am very sorry, I can't decide immediately, at least not alone. My niece knows that I am going to give her some jewelry, and I want her to select the present herself. Now, we might do this: I know that I shall take one of these two necklaces, but not which one. Would you be kind enough to wrap them up and come along with me? I am Count Montepin and I am at the present living on my estate on Boulogne-Seine. We can be there in about 20 minutes. Then my niece, who is living with me, can select the necklace she wants, I will pay you and you may take the other one back. Of course, you can go with me in my auto, and altogether the whole thing will not take more than an hour."

The jeweler hesitates for a moment, and then agrees to do as asked. And a minute afterward they whisked off in the auto.

About 20 minutes later the car stops in front of a large iron gate. A footman in livery comes rushing out, opens the door of the auto and conducts the two gentlemen into a large reception room. The count hands him his overcoat and hat, whispers something in his ear and takes the jeweler into an elegant sitting room.

"Would you kindly give me the two for a moment? I will then take them to my niece's room and will be back in five minutes."

The jeweler hesitates. He is suspicious, and not without reason. He remembers several cases when he has been swindled himself, and also others which have happened to his colleagues. But the surroundings reassure him. The furniture in the sitting room represents a value of at least 50,000 francs. The house is large, and it is evident that there are a number of servants. He gives the count the two cases, the one containing a necklace worth 175,000 francs, and the other one 10,000 francs more.

"I thank you," the count says, and leaves the room. The jeweler looks around and admires the costly Persian carpets, a large portrait by Bonnat, an excellent aquarel by Devanberg, a number of statues in bronzes and marble, and costly bric-a-brac of all kinds. He tells himself that his first estimate of the value of the furnishings is too low, and that they are at least worth 100,000 francs. He sits down again, and after a while he looks at his watch; it is just 15 minutes since the count left him.

Five minutes more passed; he began to grow nervous. Then 10 minutes passed; and he is really worried. He opens the door and sees the footman standing outside, and asks him if he thinks he will have to wait much longer.

"Certainly not," the footman replies; "my master must be here in a minute. If you will only have patience a moment I am sure he will be down."

The jeweler returns to the sitting room and walks up and down the floor rather excitedly. Five minutes passes, 10 minutes, 15 minutes, half an hour. Then he can stand it no longer, and he goes out again and asks the servant, who replies: "I am sure, if you only have patience a few minutes longer—"

"Patience! Patience! It seems

When writing advertisers mention Cultivator

to me that I have been waiting long enough. It is now more than three-quarters of an hour since the count went upstairs, and he said he would be back in five minutes. I gave him some very valuable jewelry, very valuable."

He is greatly excited now and talks loud. Just then the door opens, and an elderly gentleman came in, and asks him to sit down.

"Really, my dear sir," he says softly, "you must not get excited. Remember the condition you are in."

"But it is quite natural that I should be excited, under the circumstances. The gentleman with whom I came here has taken—"

"Yes, yes, I know. He has taken your pearl necklace; but just try to be calm. You will certainly get them back, and it is absolutely necessary that you do not get excited."

"What do you mean? I have nothing to do with you. I do not know you at all."

"Now, really, you must try to calm yourself or you shall again have a headache."

"Headache! What the devil do you mean? Give me back my necklace or—"

He raises his hand as if to hit the old gentleman, who does not seem the least scared, but presses a bell button.

Four servants come rushing in and take hold of the jeweler, who is now thoroughly aroused, struggles to free himself while calling them all sorts of names.

The men do not reply, but hold him as if in a grip of iron.

Seeing that it's impossible to free himself he makes an effort to appear calm and his voice trembles only a little as he says to the old gentleman, whose eyes have been resting on him all the time: "If you are not a swindler, like the other, I want to tell you that I am the victim of an unheard-of—this Count Montepin, as he said he was, came to my shop about an hour ago and selected two necklaces of great value."

"My dear sir," the other interferences.

"You do not believe me? Please tell your servants to release me just for a moment. In my pocketbook I have my cards and several letters addressed to me. My name is Michael Zabriskie, and I am the jeweler who owns the large establishment at No. 10 in Rue de la Paix. I give you my word of honor that this is so and it would be very easy for you to find out whether I speak the truth or not. Telephone to Paris, call up my establishment and find out if it is not true that the count came into the store and asked me to go with him to his estate that he might show the jewelry to his niece."

His voice is now so calm and convincing that the old gentleman looks at him in surprise and orders the four servants to let him have the use of his hands. Then he goes outside to telephone, when he returns again he is pale with excitement, orders the servants to leave the room, approaches the jeweler with outstretched hands.

"My dear sir," he says, "I cannot tell you how miserable I feel. Without knowing it, I have been acting as the accomplice of a clever swindler and I am quite certain that you will never see your necklaces. It is the most daring affair I ever heard of. You are at present in a private insane asylum belonging to me. I am Professor Plancon. The so-called count came to me some days ago and

told me that he had a brother-in-law, owner of a large jewelry store, who had formerly been exceedingly wealthy, but who had been very unsuccessful in business of late. This had affected him so much that he had lost his mind. At the present time he was suffering from the delusion that somebody had stolen some pearl necklaces from him and it was to be feared that he might become violently insane at any moment. I am going to bring him to this place under some false pretense, he said to me, and you will do everything in your power to cure him. For the sake of my sister and the children I hope that he will be able to leave this place again, cured, in a few months. As to the cost, it does not matter. Our family is very wealthy and will pay any price and with these words the count produced a wallet filled with large bills and paid me 5000 francs in advance."

The jeweler has never recovered the necklaces since.

—Spokesman Review.

RECIPES.

Ginger Bread.

My favorite recipe for gingerbread has not the advantage of being inexpensive, but it is delicious. Melt one-third of a cup of butter in two-thirds of a cup of boiling water, and add one cup of molasses, and one egg well beaten. Mix and sift two and three-fourths cups of pastry flour (once sifted,) one and one-half teaspoons of soda, one-half teaspoon of salt and two teaspoons of ginger. Add to first mixture, beat thoroughly, turn into a buttered and floured shallow pan, and bake in a moderate oven over thirty minutes. Vary the flavor sometimes by using one teaspoon each of ginger and cinnamon and one-fourth of a teaspoon of cloves; then bake in buttered and floured individual tins.—October Woman's Home Companion.

Cheesed Tomatoes.

Cut stem end from well-shaped tomatoes and scoop out the heart of each. To two tablespoons of tomato pulp, add one teaspoon of bread crumbs and one teaspoon of crumbled cheese. Season to taste and fill tomato shells with the mixture. Replace stem ends, bake in roasting pan for twenty minutes, transfer to hot platter and serve.

Scalloped Salmon.

Take one can of salmon picked up finely, butter a pudding dish and put a layer of cracker crumbs on the bottom; then a layer of salmon with bits of butter, salt, pepper, a trifle of tomato, fresh or canned, and a little milk. Proceed in this manner until the dish is full, having the buttered crumbs on the top. Add milk to make quit moist, and bake one-half hour in quick oven. This makes a simple and tasty dish for supper.

Miss Knowsitt—Now that I've graduated from the seminary, I think I'll take a course in psychology.

Mr. Knowsitt—Not on your life. You'll take a course in roastology, boilology, sweepology and domestic workology.—Pittsburg Dispatch.

Old Party—Boy, you'll catch cold if you get your feet wet in that puddle.

Small Boy—Dat's what I'm after I'm a-goin' to speak "Spartacus to the Gladiators" at school on Friday, an' I wants to git me voice hoarse.—Chicago News.

NORTH

TELEPHONES specially adapted to farm lines. Sold direct from factory. Book of instructions how to organize farmers and build the line. Write for Bulletin No. 338. The North Electric Co., Cleveland, O. Kansas City, Mo. Dallas, Tex.

Just Listen a Moment

You can hear lots of important news—The Hog Market is up—ship that carload. Wheat is off a cent. Information like this is important to every farmer—and it can be had for less than a cent a message if you and nine or ten of your neighbors will build your own telephone line.

Stromberg-Carlson Telephone

equipments can be bought at reasonable prices. Our directions are so plain and simple that you can put up the line with little effort. Over one million Stromberg-Carlson telephones are in use today. Write today for telephone book "How the Telephone Helps the Farmer," 25th edition and other literature, sent free.

The Produce Markets

LOS ANGELES, Nov. 26, 1907.

Butter.

Butter conditions remain much the same as last week. Quotations are exactly the same. Receipts normal.

Creamery extra per roll... 67½
Firsts... 65
Seconds... 60
Dairy... 45
Cooking... 45
Eastern... 60
"Butterine"... 15@22½

Cheese.

Cheese has advanced slightly in some grades and is now quoted higher for California Young America. Anchor is slightly lower.

Cal Young America per lb... 20½
Hand... 20½
California Anchor... 20
Northern fresh... 18
Eastern singles... 19
Imported Swiss... 32
Tulare flats... 18½
Domestic Swiss... 22@23
Oregon... 18

Eggs and Poultry.

The egg market is hardly as strong and some sales are made below quotations.

Eggs local candled... 45@47
Eggs case count... 41@42
Fresh Eastern... 36@40
Eastern storage... 23@26

The poultry market is decidedly interesting. Wholesale price of dressed turkeys will approach 30 cents. Fairly good live stock quickly commands above 20 cents. Ducks and geese are very scarce. A dealer who has any of them can obtain almost any price he desires. At present 20 cents is being paid to the jobber, and in some instances even more. An additional 5 cents is put on them by the retailer, and thus they are almost as expensive as the Bird of the Pilgrims.

Hens per lb... 14@15
Young roosters per lb... 16
Fryers... 16@17
Broilers per lb... 17
Old Roosters... 3½
Turkeys... 20@21

Rolled barley... 1.75

The "Success" (no lamp) Incubator and Automatic Nest Co. have just gotten out the most modern (although inexpensive) poultry plant plans that genius and systematic experience have as yet brought into practical use.

The "Success" poultry house floor plan and elevation 8x8 and 8x11 drawn on scale of half inch to the foot, together with complete specification sent to any address in the U. S. for the small sum of \$1.00.

This house combines the roosting room, the scratch room, laying department and feed yards, all under the same roof, affording more convenience than any other style of house containing the same amount of material. Any reliable architect would charge five to eight dollars for making these drawings and specifications.

Any one contemplating the establishing of a first-class poultry plant cannot afford to be without the drawings, 25x17½, and complete specifications by the inventor of the "Success" (no lamp) Incubator, Brooder and Automatic Nests; price, \$1.00 by mail.

There is no better security against loss or hardships during a season of money stringency than a good flock of laying hens.

Write us for free circulars on the subject.

We are going to give away a few of our machines for the purpose of advertising them. Watch for the announcement.

The "Success" (no lamp) Incubator Co.,

J. W. O'Keefe, Pres.,
White Salmon, Wash.

Everything For Spraying

Whatever you want for spraying, be it pumps, equipment, or materials, write to us. We can supply promptly and at reasonable prices, Bluestone, Caustic Soda, Arsenate of Lead, Hose, Nozzles, Aluminum Spray Rod, everything.

Bean Spray Pump Co., 161 West Santa Clara St.
San Jose, Cal.

WITH A SEIVERT OIL BURNER

You can burn 100,000 feet of air with every 130 gallons of oil; this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel. The only safe and reliable burner on the market. Send for full particulars.

SIEVERT OIL BURNER CO., 1001 No. Alameda St., Cor. Main and
Ord Sts., Los Angeles, Cal.

San Francisco Markets

SAN FRANCISCO, Nov. 25, 1907.

TALLERDAY SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only way to irrigate alfalfa. Cheaper than Flumes. This is only one of our specialties. We make **Riveted Water Pipe** in lengths of ten feet from single sheets. Let us prove to you that we make **Pipe and Tanks right**. WRITE FOR CATALOGUE.

TALLERDAY MANUFACTURING CO.
636-7 Pacific Electric Building Los Angeles, Cal.

The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine straight ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gauge depth to which moldboard should cut. It's a very desirable machine for road-building in city or village. It makes good roads and keeps them so. Although made of steel and malleable iron, still it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveeing, Foundation-digging.

For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet, "Delightful Roads." It's free and tells you all about the 20th Century.

Light Your Place by Electricity

Electric Light is very economical if you have this outfit—a Fairbanks-Morse Engine with Dynamo. The Dynamo current operates incandescent or arc lights, electric fans, pumps, motors, etc. Shift the belt to the other fly wheel and drive any kind of machine—grinder—churn—buzz saw—separator. Save yourself time and labor by installing one of these outfits on your farm. Soon pays for itself. Simple, safe, reliable. Ideal outfit for farmers. Lowest running and repair cost. Our name your guarantee.

Coulson's Improved Mash Egg Food

Takes
Less
Feed

Makes
More
Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of **COULSON'S NO. 3 CONDITION POWDER** will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time they must have the best food you can give them from the commencement of the molt. You will find **COULSON'S IMPROVED MASH EGG FOOD** is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-Pound Sacks
Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

COULSON'S IMPROVED MASH EGG FOOD is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect **COULSON'S IMPROVED MASH EGG FOOD** shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

The Agricultural College and Dairying

By E. J. Wickson, Dean
of the College of Agri-
culture and Director of
the Agricultural Experi-
ment Station of the
University of California

At the Convention of
the California Creamery
Operators' Association,
University Farm, Davis,
Yolo County, California,
November 22, 1907

ACCCEPTING your kind invitation to address your convention I desire first to sincerely thank the California Creamery Operators for their earnest and persistent support of the measures which have secured for the agricultural department of the University of California the possession of this grand farm as an addition to its equipment for instruction in policies and practices which minister most directly and surely to success in the rural industries of California. As the law prescribes, the University Farm will advance in equipment until it is "producing the general crops of the State and as many as may be of all the crops and products successfully grown in California."

In the various branches special instructors will be provided who will be expert in knowledge and apt to teach. Professor E. W. Major and Mr. E. H. Hagemann are now at work on equipment in dairy lines, and Dr. Leroy Anderson will soon return to the service of the university after his most successful and creditable work in building up the California Polytechnic School at San Luis Obispo. These men, and others who will assist them, will carry the special instruction in various phases of dairy production, and in due time announcement will be made of the details of the undertaking. It is timely for me, perhaps, to present a few general considerations in favor of dairy promotion, and to claim that dairy advancement rests largely upon special efforts in research and instruction, which it is the duty of the university to put forth. My subject then, will be, "Some of the Relations of the Dairy Industry in California."

Relation of the Dairy to State Development.

The annual output of products of an estimated value of twenty-two millions of dollars constitutes the dairy industry, one of the leading agricultural interests of California. The fruit products are thrice as great and the grain crops have, in years good in price and yield, been twice as great, but fruits and grains have attained their pre-eminence along avenues of export. Our dairy products are almost wholly consumed within our own State lines and though expansion through export seems attainable, it has thus far been realized only in very small degree. It is fair to claim that what has thus far been accomplished in the development of dairy husbandry in California is but a promise of future greatness and that present opportunity is vastly greater than achievement. This fact has been clearly perceived for several years, and commendable effort has been continually put forth by dairy proprietors and their skilled employees to lift their work to the exactness of practice and uniform excellence of products which are attained by faithful adherence to modern dairy principles and methods. Without such advancement the industry can only remain provincial and must suffer within its own territory by competition with high-class, dairy products brought from other

regions, many of which are less favored naturally. So long as we are buying butter, cheese and pork products by the million dollars worth from the producers of other States it is of very great advantage to the State to promote dairying upon the lines of the best methods and the highest quality of products, because it will cancel the great tribute we are paying to other States for what we can produce ourselves, and because it will enable our people to easily pay taxes upon an increased home valuation instead of really paying taxes upon the increased valuation in other States, as they are now doing.

Relation of Dairying to Land Values.

I have spoken of the increased assessed valuation of California through the extension of the dairy interest as desirable and of the taxes as easy to pay. This is true because the dairy, if properly conducted, will make productive and profitable much land which is now almost a burden to the owners. Our grain lands are coming close to the line of actual loss, because of the reduced product per acre. With our cheaper methods of seeding and harvesting, grain growing would still be profitable if larger crops could be had. The dairy will render profitable much land which is not well adapted to other agricultural specialties.

Fruit trees and vines have been planted on thousands of acres upon which they will never yield profit. The sooner these lands are turned over to some proper line of animal industry, the better it will be for the owners and for the State. These lands are of several kinds and they are found all over the State. There are dry lands which produce small fruit and stunted trees which, if properly handled, will yield rich winter pasturage; there are low lands which are too frosty for fruits, or too wet in winter for the health of the trees, which need only good farming to secure immense yields of summer pasturage or silo crops. There are also large areas of lands capable of reclamation, upon which large herds of dairy stock could be very profitably maintained. All these directions of making scantily-profitable lands yield satisfactory income constitute the dairy of distinct and important value to the State.

Relation of the Dairy to Soil Fertility.

A dairy by-product which is seldom figured is the manure. Careful experimentation has shown that the excreta of a dairy cow are worth about eight cents per day, computed at the standard valuation of the plant food substances which they contain. This for a year would be \$29.20 per cow, and for the 405,616 milch cows which the Department of Agriculture credits to California in January 1907, the total value would be \$11,843,987.

The worth of manure is conditioned upon the character and amount of the food supplied to the animal, and the current estimates of value may

be based upon higher feeding than California dairymen practice. Suppose, then, we discount the above total one-third, we would still have about \$8,000,000 as the value of manure as a by-product of California dairying. This by-product is not sold. If the dairying is properly done every possible part of it is restored to the soil, not only maintaining, but increasing its fertility. The dairy is, in fact, not only restorative, but productive of new plant food in the soil.

If then it is claimed that the value of the manure should not be counted, because it is not sold, but is restored to the land and used in subsequent production of dairy products, the answer is that the dairy must be credited with this value because it is doing what other leading agricultural industries do not do. Our fruit industries make no adequate return for what they take from the soil, and fruit growers are each year paying a larger part of their gross receipts for commercial fertilizers.

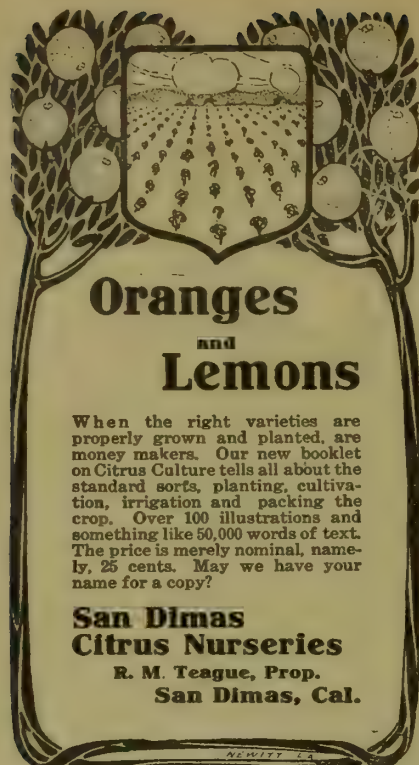

Our hay and grain and other field crops are robbing the soil until its poverty is becoming conspicuous and still very few growers can command knowledge and courage enough to be generous with the soil. The dairy, if at all properly conducted, is a great conservator and returns to the State continually more than it takes. On this ground alone the dairy industry is of great value to the State and its improvement and extension are matters of the clearest public benefit.

Relation of the Dairy to Mixed Farming.

Another element of value in the dairy lies in the fact that the cow is the corner stone in successful farming. It is becoming more manifest each year that there is greater safety and prosperity in developing in each region, and in many cases on each farm as well, certain related lines of production to which the conditions are suited. The dairy is a leading factor in diversification, because it is capable of intensive culture and it returns a high-priced product upon which much labor and investment can be profitably bestowed. Not only is this of great help in making single farms profitable and their owners prosperous, but it distributes its benefits all through communities, it gives regular employment to thousands, it stimulates local trade and builds up towns and villages and assists in the development and progress of all good enterprises.

Proper rotation of cropping and pasturage will restore the grain yield to better figures and it will bring into our pockets the millions in value of plant food which our purchase of dairy products leaves to enrich distant supply regions. Wherever dairying has been properly introduced into the grain districts of the State there is to be found abundant testimony to the truth of this claim. Dairy extension will increase our grain product and make it profitable.

PLANTING CITRUS TREES IN FLORIDA.

AN interesting view of conditions and methods of work in Florida, is given in the following from the Florida Agriculturist:

One of the best times in the whole year is now approaching for the setting out of orange and grapefruit trees, and a few words at this time will, I think, not be amiss, and may possibly be of service to some that have in mind the setting of young trees or groves.

We will now assume that we have a piece of flatwoods pine land that is of good quality, that we have it well drained with ditches of sufficient size to carry off the surplus water quickly; that we also have this land plowed into beds, say 25 feet from center to center, and the ground nicely shaped or graded to the water furrows, so that we can run the point of a mowing machine right down to the bottom; that the bottom of these furrows is about eighteen inches below the top of the beds; that this ground has been in cultivation to some crop for one or two years; that it has had sufficient time since being plowed last for the soil to knit well together (this is important in setting trees), and that this land is capable of growing a good crop of grass without further fertilization. We then assume that a body of timber is on the west or north side, at no great distance, that it is likely to remain for some time, or, better still, that we own it and thus assure its supremacy. Having all these things we have an ideal place and condition of ground and location if not too far north.

Now to setting these trees, we will take into consideration the most important of all things, the distance apart they should be set. Some will say thirty feet, others twenty, and still others different distances, from fifteen to forty. I have already said we had our land plowed into beds of twenty-five feet. I should prefer to have these run north and south if possible, but if not it don't make a great deal of difference if they run east and west. This indicates that the trees are to be set twenty-five feet one way, this puts the rows sufficiently wide apart that we can use a mowing machine conveniently, and no grove of any size should be managed without one. Now, having our rows twenty-five feet apart, we will set our trees about twelve feet apart in the rows. I know there will be lots of dissenters from this in the old school of orange growing, and accordingly I will go into detail as to why they should be set close. First, no one will dispute the fact that there is no place in this great State of ours that is free or exempt from severe cold. I think the Supreme Architect of the universe has demonstrated this pretty thoroughly in the last few years. Also it is a well known fact that an orange grove like a body of timber, will retain its own heat, and the thicker the timber or trees, the better it will do this; therefore, to better protect them from freezes is one reason for planting close. Another is, they will better protect themselves from damage to fruit as well as to the trees by high

or heavy winds. Also we are enabled to get better fruit on the closely planted trees by not having them exposed so much to the sun, as well as the wind, where the trees are thick. Now, summing all up, the trees are much better enabled to withstand the ravages of all the elements, they will bear just as well bring finer fruit, grow lower to the ground, cost less to gather the fruit take less cultivation, and for the first ten years bear twice as much fruit as if they were planted twice as far apart in the rows, as is common practice; hence, be twice as profitable for the first ten years. If at the end of that time it should be decided that they are too thick to be profitable every other tree can be transplanted into a new grove, and if well and carefully done, in two years it will bear again and bring nearly half as large a crop as it did on its old stand.

A good many years ago I had my attention first called to this matter of close setting trees. Near where I lived were several small groves, and in each of those I have in mind, was a small body of trees that had been budded on their natural roots and never were moved, and these trees were very thick, standing very close to one another. I have watched them year after year, and they never failed to bear good crops. No matter what the surrounding grove did, they did their duty, and not only so, but the fruit was a larger per cent fancy and not as subject to rust.

On the grove I now have, a portion is set close and it far outstrips the which is set the usual distance. In the groves that I set are planted as above described, and there is no question that as the prejudice against it is overcome it will be the modern method of planting.

SOME SOURCES OF NITROGEN.

NITROGEN is the most expensive of the fertilizing materials, and for this reason especial care should be exercised in purchasing materials containing this element.

Organic Forms.

Two organic forms very much used in Florida are cotton-seed meal and dried blood. If we judge cotton-seed meal solely by its nitrogen content (about 6.6 per cent. on the average for bright meal), its present high price would place it at a great disadvantage when compared with such materials as nitrate of soda and sulphate of ammonia. It should be remembered, however, that the meal contains also some phosphoric acid and potash. Jenkins and Street (Cotton-seed meal as a fertilizer. Conn. Expt. Sta. Bulletin No. 156), have pointed out that the average of 3 samples showed 2.97 per cent. phosphoric acid, and 1.90 per cent. potash. Now, if we accept 20 cents a pound as the price of nitrogen, 5 cents for phosphoric acid and 5 cents for potash, then for a ton of cotton-seed meal analyzing 6.6 per cent. nitrogen, 2.97 per cent. phosphoric acid and 1.90 per cent. potash, the calculated value would be as follows:

Nitrogen	\$20.
Phosphoric Acid	29.7
Potash	19.0

Total \$31.60

Bright cotton-seed meal is now quoted on this market at \$31.60, and it will thus be seen that the cal-

Sour and Sweet Orange Seed Bed Plants

The Finest Lot in California

My sour orange plants are grown from seed off the wild orange trees of Florida. Trees grown on this stock are very desirable for planting in heavy soils or lands that are subject to excessive moisture or drouth, also lands underlaid with clay or hardpan or poorly drained. Its most valuable feature is its resistance to gum disease.

My sweet orange plants are grown from seed off very large, old Tahiti seedling trees, thus making the very best foundation to grow an orange orchard on. Don't fail to see my stock before you buy, or address

William Wood, Box 118, Whittier, Cal.

Green Manuring

Now is the time to plant crops for green manuring. The best crops for this purpose are Vetch, Canadian Field Peas and Fenugreek. For information and prices of the seed write to

Johnson & Musser Seed Company

113 No. Main St., Los Angeles

For Gardening, plant Onions, Lettuce, Spinach, Turnips, Beets, Radish, Carrots, Cauliflower and Cabbage.

When writing advertisers, mention Cultivator.

lated and market price are practically the same. If we assign the same value to the nitrogen in nitrate of soda, namely, 20 cents per pound, then nitrate of soda analyzing 15 per cent. nitrogen would be worth \$60.00 per ton. Nitrate of soda is quoted on this market at \$59.60 per ton, so that we see here again the prices as calculated and as quoted, running very close together. Thus it would appear that when we take into consideration all the plant food elements, cotton-seed meal is but little, if any, more expensive, proportionately, than nitrate of soda. Should we adopt some other figure as the price of nitrogen, 17c for example, the same relationship would hold true, that is, the ratio of the calculated to the market price of cotton-seed meal would be practically the same as the ratio of the calculated to the market price of nitrate of soda. It may be noted that the fertilizing elements in cotton-seed meal become available rather slowly, and on this account are not lost by leaching to such an extent as nitrate of soda or sulphate of ammonia would be. Hence, for crops that remain in the ground over long periods of time, as the pineapple, citrus and other trees, this form of nitrogen would seem especially adapted.

Dried blood is considered one of the best sources of organic nitrogen. It contains 13 to 14 per cent. of nitrogen, and decays rapidly when placed in the ground. Organic materials, such as cotton-seed meal and dried blood, must undergo, in the soil, natural processes known as nitrification, before their nitrogen can be assimilated by the plant. The nitrification processes are dependent upon minute organisms known as nitrifying bacteria, and these in turn require a certain degree of warmth and moisture. Fortunately for the farmer, these organisms are almost universally present in soils that have been properly cultivated and drained. This fact is well illustrated by the rapid disappearance of animal excreta or meat scraps after being burned in good soil. Nitrification does not take place so rapidly at the surface as it does a few inches beneath the surface; and furthermore, the loss of nitrogen by escape of ammonia into the air will be greater if these changes take place at the surface. Hence the importance of placing organic fertilizers lightly beneath the surface of the soil.

Organic Forms.

Nitrate of soda is very soluble in water, and when thus dissolved, can be taken up by the plant directly without further change. The ease with which this material dissolves, makes it an expensive source of nitrogen to use during rainy periods. For use during periods of drought, and for quick-growing crops, it is especially adapted. It contains about 15 per cent. of nitrogen.

Sulphate of ammonia contains about 19 to 22 per cent. of nitrogen, and is also readily soluble in water. Much of it, however, is probably not taken up by the plant until it is converted, by bacterial action, into the form of nitrate. It is regarded by some as unsuited to soils having an acid tendency. It should not be used directly with lime, as in this case the lime would be likely to liberate ammonia. Lime does not, however, have its effect upon nitrate of soda.—A. J. Blair in Bulletin of Florida Experiment Station.

Oroville orange growers are getting \$2.25 per box for their fruit.

EDUCATION IN AGRICULTURE.

In speaking of the advantages of technical secondary education in agriculture mechanic arts and home economies in support of his bill to provide an annual appropriation for industrial education in agricultural high schools and in city high schools and for branch agricultural experiment stations and regulating the expenditures thereof, Hon. Chas. R. Davis of Minnesota said:

A Federal appropriation is sought for the purpose of encouraging the several States and territories in the promotion of industrial and agricultural education, and with their co-operation. It is mainly for the purpose of encouraging a type of education for the mass of our people that will train them for the practical affairs of life; and while the Morrill Act of 1862 has undoubtedly stimulated great activity along this line, the present measure supplants it and to a large extent will consummate the purposes desired. The science of agriculture is basic in principle, and sooner or later we should return to first principles, and in the last analysis we must recur to the soil as the fundamental source of our wealth, prosperity and happiness as a people. The practical training to be obtained, if this bill becomes a law, for the young men and women on the farm, will undoubtedly make country life more attractive and beneficial and the industrial training sought to be encouraged in city schools add very materially to the prosperity and happiness of all those who will avail themselves of the opportunities thus provided. The measure, therefore, responds to the needs of both rural and city conditions.

This bill is designed especially to secure simple justice to the workers and homemakers of our country. We have too long confined technical education to the professional classes. Let us carry out the wise plan begun by Congress in 1862—the land-grant act establishing colleges of agriculture and mechanic arts—and provide, along with general schooling, industrial education, not only to the privileged five per cent, but also to the 95 per cent who are doing the world's work.

The increase of knowledge, the specialization of industries, and the close division of labor have made a new world, into which the graduates of our schools are precipitated. The old education leads the pupil to believe that he is prepared for life. His preparation is only general. The new education must prepare the pupil for some specific line of life. It must be both broad and practical. It must combine the theme written in the book, the theme written in the soil and in the machinery, with the inspiration for the best living which modern conditions can provide.

CONSIDERATE BRIDEGROOM.

A Belleville girl and a young man, both of whom had steady jobs, were married the other day. The day after they were married the girl said to her fond husband:

"Oh, George! now that we are married, there is only one thing that I regret; and that is that I have to give up my fine position."

The fond young husband stroked the silken tresses of the young wife's hair and soothingly replied:

"Now, darling, don't worry. You needn't give up your position. I'll give up mine."—Judge's Library.

I.H.C. IRRIGATING ENGINES

If the Water is Lower Than Your Land an I.H.C. Gasoline Engine Will Solve the Problem.

THAT is often the problem with irrigators—the water is lower than the head of the ditch. The old way of doing was to construct the ditch up stream (often several miles) and head it high enough so that the water would flow down upon the land. If the only available water was a lake or pond below the land, irrigation was usually abandoned, because it was thought that the water could not be pumped up in sufficient quantities, or the pumping operation would be too expensive.

Irrigators know better these days. They are now placing I. H. C. gasoline engines on the banks of these low lying lakes and converting the waters to a beneficial use on their thirsty lands. They no longer find it necessary to build miles of extra ditch to get fall enough to reach the lands. An I. H. C. engine will take the water from the stream where it flows through or near the farm, and raise it any reasonable height.

Irrigation problems are solved with the I. H. C. engines, because they have three main characteristics that adapt them to the work:

First—They pump water in unlimited quantities.
Second—They raise water at a low cost.
Third—They make a near approach to self operation. When set going they run for long intervals, regularly and dependably, with the least possible attention. The result is that I. H. C. gasoline engines are completely changing irrigating methods. Fertile but dry uplands are being brought under cultivation where a few years ago that was thought to be impossible.

Have you a dry farm on your hands? Or do you know of a fine piece of land you would homestead if you could get some "unappropriated" water for it? There is no reason why you should abandon your project. There's always near at hand a low lying lake or a slough or an underflow or a well or a stream down at the foot of the bluff. Find anyone of these, and an I. H. C. engine will put the water where you want it.

The engines are made in various styles, Vertical, Horizontal—Portable and Stationary. They range from 2 to 20-Horse Power.

Look into the matter and see which one of these irrigating powers will do for you. The local International agent will be glad to talk over your particular case, furnishing catalog and giving engine particulars. Or if you prefer, write nearest branch house for catalog.

Live Stock and Dairy

THE BERKSHIRE.

THE Berkshire is one of the most popular money makers in America. He matures early, is a good grazer and takes to California alfalfa like a duck to water, and then fattens and hardens up quickly on grain.

It is a native of the county of Berkshire in Southern England, where the history is traced back until the middle of the eighteenth century. It was greatly improved during the early part of the nineteenth century, by the introduction of Chinese and other blood.

It was first introduced to America in 1823. In '39 to '41 the importations became much more frequent and was warmly received in the "West," which was Ohio at that time, where it has ever been a favorite.

Pigs should weigh at six months, 175 pounds and at twelve months 300 pounds.

They mature early and fatten easily.

AGRICULTURE COLLEGE AND DAIRYING.

Continued from First Page
Relation of the Dairy to Labor Supply.

Although the unsatisfactory labor supply is at present one of the greatest drawbacks to dairy production, the extension of dairying at present prices, which bid fair to be indefinitely maintained, will actually increase the local labor supplies, because of the attraction which it offers for profitable, regular employment. In fact, the dairy industry has a clear, corrective influence upon what are considered some of the evils in the labor situation in this State. Our present possession of dairy cows employs upwards of 20,000 people and they are continually employed and comfortably housed. In the dairy connected with other crops the hands can give part of their time to other work as required, and thus the dairy is the key to continuous employment of nearly all farm labor, except in harvest rushes, and will point the way to the better general condition of our farm laborers which is so earnestly desired by all. Thus the dairy becomes a valuable reform agency, ministering not only to the prosperity and comfort, but to the moral welfare of our laboring population.

Relation of the Dairy to California Agricultural Science.

Dairy progress is one of the most striking and significant demonstrations of the value of applied science along agricultural lines and is, perhaps, the most widely recognized of all the triumphs of agricultural college and agricultural experiment station work. In California there are conditions which suggest opportunities for the enlistment of trained young men and women in the up-building of a new dairy interest which shall vastly surpass anything thus far attained in this State.

One thing which is particularly interesting in the dairy industry of California, is the great variety of conditions to which local practice must be intelligently adapted. Though there are, of course, lines of policy and practice which are everywhere alike, there are others which

are, or should be, strikingly different, and therein lies the opportunity for insight, research and great progress in selection of materials and modification of methods. This is true in all departments of dairy work, from the selection of forage plants and the care of stock all the way through the dairy curriculum to the manufacture and care of the product.

There is no variation on the Atlantic slope as can be found in California, but there is something analogous in Europe if one includes this view the dairying of the Alpine valleys, of the moist, dyked lands of Holland, of the heated, irrigated plains of Italy and of the coast lands of Normandy with their perennial pastures born of equable temperature, abundant rains and fogs. Close resemblances to all these various conditions can be found within the boundaries of California, and how secure for each of them suitable forage plants and most productive cattle and types of product which shall best present their distinctive adaptations acceptably to the consumer, a question of much complexity.

Shall California compare its conditions with those in distant regions which they seem to resemble and try to borrow wisdom from the results of centuries of old world experience? That is the method which was tried at first with our fruit products. The utmost effort was made to learn exactly the ways by which the French made prunes. Now California is producing one hundred and thirty-five million pounds of prunes a year in ways the French never thought of, and is exporting a surplus to Europe—even selling some of them in France. The utmost effort was made twenty-five years ago to ascertain just how irrigation was done in Italy, in Algeria and in India. Now commissioners come from all arid countries to study the California methods of irrigation. There is full reason to think that our dairy development will also proceed along original lines, and it rests with the rising generation of technically educated men and women to master the situation and to invent the methods of advancement which are likely to be characteristically Californian.

Relation of the Dairy to Special Lines of Research.

But though this element of originality will mark the methods which are finally adopted as best suited to our conditions, their attainment will be promoted by the same attitude of mind and the same diligence in search and experiment which prevail in all advanced dairy circles. The powers of the trained dairy student have rich opportunities for achievement in this State, some of which may be suggested:

Which ones of the many dairy breeds will best befit the various regions of California? Many have been brought here, their influence upon the common dairy stock of the State has been good, and we have, as a rule, very creditable grade cattle for dairy purposes. But here, as elsewhere, dairy profits are reduced by feeding cows which do not pay the way. It is also undetermined the

the good ones are as good as they may be or as well suited to the distinctive conditions of the different regions. Experiment and close observation are needed in all parts of the State to lift cow-power to the highest attainable point.

Which are the forage plants which, under the influence of local climates and local soils, will enable the best cows to reach their fullest production? Ever since the first years of the American occupation alfalfa has been grown in California and yet its area has increased more in the last five years than in all the preceeding forty. We are, perhaps, doing more with alfalfa than any other State or country in the world, and yet we have hardly learned the vast value of the plant and the best ways to use it in feeding practices. Alfalfa probably still contains more potential wealth for the State than any other single member of the plant creation. A priest and prophet of alfalfa has not yet appeared above the common level of mankind. And yet alfalfa has serious limitations and is not adapted to great districts of the State. Other plants must be sought. For twenty years the College of Agriculture of the University of California has been introducing forage plants from all parts of the world to determine by experiment which would thrive under trying conditions in this State, and some notable results have been attained, but the opportunity for enriching the pastures of California and multiplying their production in live stock and dairy lines still remains for devoted effort and close observation.

What foods can be best locally grown or manufactured to profitably supplement pasturage? This is an almost unexplored field of investigation, so far as the general dairy practitioner is concerned. Too many are keeping but one cow to four or five acres of land, which should support twice as many if more intelligently administered. This is in part involved in the pasturage, which has already been mentioned, but, beyond that, the production and conservation of supplementary food remains as a wide field for improvement. There is seldom reason why a cow should go a day without succulent food, if her owner has the knowledge and the energy to provide it. There is no reason why she should pass a third, or a quarter of the year in idleness while her inhuman owner robs himself by half starving her because she is yielding nothing.

As to Silage.

There are several hundred silos in the State which conserve succulent forage, as the jar preserves table fruit, and keep the cow up to her fullest production and in the jolliest comfort, though the pastures be bare as the roadway. There should be a hundred times as many, and there will be as soon as their value and plain practicability are better understood. The science of suitable and adequate feeding affords an almost limitless opportunity for advanced research, thought and practice.

Although California has, deservedly, a good reputation for excellence in the butter product and for such high average quality that "cooking butter" is always scarce, there is still opportunity for improvement.

See us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 S. Los Angeles street., Los Angeles.

Though we have exceptional advantages in attaining high quality, because the dryness of the air while the temperature is high measurably prevents unsound fermentation in the milk, it is true that much of our butter is below the high standard which modern commercial dairying prescribes. We need better conception of quality, better knowledge of how to attain it and a wider use of the agencies recently devised to secure the largest amount of the best product at the least cost. Here are manufacturing problems than which the whole list of agricultural arts presents none which make such sharp requirements upon the talent and training of the operator. He has to deal with a most perishable material, full of unstable compounds, absorptive of all atmospheric ills, endangering by slight changes of temperature and commercially ruined by any lapse of perception or judgment upon his part, and is required to baffle all adverse conditions and agencies until he has at length imprisoned ethers light as the fragrance of a flower in a golden solid, pure and permanent and permanent because pure. Our grandmothers did this empirically sometimes by the roll or firkin; our butter makers of today must do it day by day, and by the carload. It can only be accomplished by the acutest perceptions ministering to true conceptions of ends to be sought, and attended by the fullest knowledge of the nature of the materials and the efficacy of all agencies employed. To know this problem is to become an advocate of dairy education. It is the only power which can help the industry.

The Duty of the State to Dairy Improvement.

The demonstration of great value to the State in the dairy industry places a clear obligation upon the State. Dairy success today is only attainable by the most complete understanding of materials and methods and the most effective protection against impurity, sophistication and fraud. These results can only be accomplished by the most patient investigation in the search for new truth and the most effective instruction of all concerned, so that all work shall be done in the full light of the latest knowledge. The State should make a liberal provision for dairy statistics, and the enforcement of the laws for dairy sanitation and bovine health, upon which dairy progress is clearly seen to rest, and for which other States have used public money freely with the most significant results and most enthusiastic popular approval. The value which the dairy industry now presents to the State is but a fraction of what it will present in the future, and the resulting benefits will be widely distributed. Dairy ownership, dairy labor and dairy commerce will all be enabled to contribute more largely to the prosperity and stability of the State, according to the degree in which State aid is generously given and wisely expended in the interest of local dairy development and progress.

Stirring the cream frequently will make more butter.

Too heavy salting destroys the flavor of good butter.

Wood Sole Shoes for Creamery Men, Farmers and Milkers. O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

DAIRY NOTES.

Pack as soon as possible after salting if you want to keep butter.

If you want the flow of milk to keep up always milk clean.

The market calls for fresh-made sweet-flavored butter and will have it.

Milking in a foul smelling stable or yard imparts an injurious taint.

In salting butter the taste is considered more than the preservation of the product.

The best cow is the cow which can make the most butterfat or milk out of a dollar's worth of food without impairing her vital forces.

Because You Need The Money

It's your business and if you don't attend to it, who will? You cannot afford to keep cows for fun. That isn't business, and, furthermore, it isn't necessary. There is money in cow keeping if you go at it right, and besides there is more fun in going at it right than there is in staying wrong.

You need a Tubular Cream Separator because it will make money for you because it saves labor; because it saves time; because it means all the difference between cow profits and cow losses.

Look into this matter; see what a Tubular will do for you and buy one because you need it.

How would you like our book "Business Dairying" and our catalog B. 250 both free. Write for them.

Deciduous Fruit Culture

IRRIGATED FRUIT.

The desirability of irrigated fruits for qualities which appeal to the fruit eater and for characters which win the first trade has long been attacked and the prejudice against irrigation from these points of view has been outspoken. This prejudice still exists in the minds of those who have not had opportunity for comparative judgment and no experience with properly irrigated fruit. Of course, theoretically the best fruit must come from a tree having plenty of moisture during its growth period. Too little water for such perfect growth would injure the fruit and too much water might also injure it, but we have never encountered such a condition in the arid region where evaporation is so pronounced that it readily overcomes any overdraft of water that may be taken in at the roots. Still there have been prejudices against irrigated fruit which have been slow to disappear even among fruit growers who might be presumed to have the best opportunities for speedily reaching sound judgment in the matter. The first striking characteristic of irrigated fruit to attract attention is the unusual size and this sets up envy among Eastern growers who have to compete with it. Moreover, the size is unmatched by richness and flavor and therefore, all this talk against the quality of our fruit is only the vaporings of a prejudiced mind. As a matter of fact the vast army of consumers knows nothing about the quality of fruit and such people buy it on sight alone.—Denver Field and Farm.

TO PLANT SEED APPLES.

Seeds of apples and similar fruits grow best if mixed with moist sand soon after being taken from the fruit. Hard drying weakens them very much. Early in the spring they may be sown thinly in rows three feet apart in good, well-enriched soil, covering about one inch deep. Cultivate very carefully after the seedlings come up, and keep the soil mellow until August. Thin to two or three inches apart as soon as the second pair of true leaves has formed.

Next spring they may be transplanted to similar nursery rows, setting them about eight inches apart. Good cultivation should be maintained for a season or two longer, when the trees should be large enough to plant out in the orchard. As they come into bearing inferior varieties may be top-grafted or budded with better kinds.

While in the nursery rows all branches and sprouts, as they start up, should be trimmed off to the point it is intended to form the head. If it is intended to raise seedlings for root-grafting proceed in the same way, except that the roots should be taken up one year after planting the seeds and grafted in the usual manner with desired varieties, it being preferable to take the scions from bearing trees.

KEEPING QUALITY OF APPLES.

The behavior of different varieties of apples in storage is a matter of vital importance in the handling of the commercial crop. The length of time that apples may be expected to keep in merchantable condition is of special interest. The following general principles are fairly well established:

1. Apples grown in a northern latitude or high altitude will keep longer than apples of the same variety grown further south or at a lower altitude.

2. Apples from old or mature trees will keep longer than the same varieties grown on young trees.

3. Fruit from sandy soil will usually keep longer than the same sorts grown on clay or loam.

4. Well colored, well ripened fruit will keep longer in good condition than fruit not fully ripe. This is subject to possible slight exceptions in the case of fruit grown on young and very vigorous trees.

It has been fully proved also that the manner in which the fruit is handled has a great deal to do with its behavior in storage. The fruit should be carefully handpicked, handled the least possible, and placed in storage at the earliest moment. The common practice of allowing apples to lie in piles in the orchard for several days or even weeks is especially reprehensible.

GOOD GRAPES.

Many northern irrigated valleys can grow apples, peaches and plums equal to the world's best. But the grapes which won the first prize over all competitors (exhibit open to the world) at the St. Louis Exposition were grown in the Lewiston-Clarkston valley. Black Hamburg grapes, such as are grown under glass in the East, and bring \$6.00 the pound at Christmas, are easily grown out of doors in this sheltered valley. Such varieties as the Flame Tokay, Malaga, Muscat, Cornichon, Sweetwater, etc., there yield enormously, crops of ten to twenty tons being common, and one grower claims 35 tons as a yield of one acre. Small wonder then that a profit of \$500 per acre is an easy trick from vineyards in Lewiston-Clarkston valley. Dr. N. G. Blalock, the foremost fruit expert in the State of Washington, freely admits that no other northwestern valley can compete with this valley in grape culture. These statements are deduced from a handsome, illustrated pamphlet on Grape Culture in Lewiston-Clarkston valley, by Robert Schleicher of Lewiston, Idaho, vice-president of the Idaho State Horticultural Society.

WHAT "OFF YEAR?"

After reading the following from The Denver Field and Farm, we imagine California orchardists will inquire "what off year?"

With all the disappointments, which have befallen the business of orcharding this year it may be said that the seeming misfortunes are proving something of a blessing after all, for the general conditions of the trees were never better than we find them today. The trees have had a good rest and are carrying a full complement of fruit buds for a big crop next year. With a soft winter and favorable early spring weather we are expecting to surpass all previous records. The best reward that we can see as a result of the off year, is contained in the fact that millions of codling moth larvae have been destroyed, because they have had nothing upon which to feed, and this redeeming feature to our notion is a blessing in disguise.

California Horticulturally

OPENING OF ANOTHER PEAR BLIGHT CAMPAIGN.

PROF. M. B. WAITE, who has spent a large part of the past two winters in California directing work against the pear blight, which has been undertaken by the Department of Agriculture, is again in California and is outlining another season's campaign against this disease. Prof. Waite states that his work this year will consist largely in checking up the work of the past and comparing the success of the work of the last two seasons. In the past two years the work has been largely in the line of practical education, in explaining to the orchardists and the Horticultural Commissioners the manner in which the work should be done and the reasons therefor. In order to accomplish this, the Washington professors who were detailed to the work got out in the orchards with pruning implements and did the work under the observation of the owners and the commissioners. This phase of the work is now ended, and those who are interested in it know practically as much about the means of checking it as their tutors. This winter the principal part of the work will be to ascertain how thoroughly the work of eradication has been carried on and how effective that work has been. Prof. Waite while here will also give much of his attention to the peach blight, which, while differing from the pear blight, has still been serious, and will come under his branch of operation.

ANOTHER WHITE FLY SCARE.

The white fly has been reported from Glenn Co. but from all that is so far known, it is some other form of Aleyrodes, and not the citri. There are a great many species of Aleyrodes in the state, and it is no infrequent thing to find some in their mature form on the orange trees. In this stage the insects of the various species very strongly resemble each other, and it requires close observation and expert knowledge to distinguish between the innocent and the dangerous species. It will be well, therefore, when any of these insects are discovered on the foliage of citrus trees, not to jump at the conclusion that it is the pest, but to have it passed upon before any alarm is raised, for the chances are very strong that it may be one of the innocent species, which, while sometimes found on citrus trees in their mature stage, do not breed on them, and it is in the larval, or scale-like form that the great damage is done by them.

THE FRUIT GROWERS' CONVENTION.

The annual meetings of the fruit growers of the state have become one of the institutions of the fruit industry of California. For thirty years now the fruit growers have met together at least once a year and discussed problems of direct interest to them. People from all of the different parts of the state meet together at these conventions and exchange experiences, talk of the improved methods of orchard work, of best varieties for growing, conditions under which varieties will do best, and the members work together for improved transportation and marketing conditions. Out

of these meetings has already grown the importance of the fruit industry to our state, an industry which is now worth to us, in all its various forms, nearly if not quite \$100,000,000 annually.

The thirty-third convention is to be held at Marysville commencing on Tuesday, Dec. 3rd, and continuing until the following Friday. An excellent programme has been prepared, and all arrangements made for the pleasure and comfort of visiting orchardists, while all the railroads have granted special excursion rates. Fruit growers who miss these conventions lose in many ways, and more than they are aware of.

PAJARO VALLEY APPLES.

It was a tradition in the early days that apples could not be grown in California, yet the Pajaro Valley alone, this season has shipped 1,500 car loads out of the state, and devoted another 500 to domestic consumption. This is but one small part of California, and this has been a short year for the apple crop. Prices have been good, and as in other branches of fruit growing this season, what the grower has fallen short in total output has been compensated for in good prices. California can grow apples, and apples which will equal those produced anywhere. In the cooler coast counties, the light colored apples seem to do best, Pippins, Pearmains, Bellefleurs, etc., while in the higher mountains there are a number of valleys in which red varieties can be grown to perfection. In the hot interior valleys, apples do not give satisfaction, and it was probably this fact that gave rise to the early impression, which has since become a tradition, that apples could not be grown in our state.

FRUIT AND SOIL SPECIAL TRAIN.

Arrangements have just been completed for the running of a horticultural and soil improvement special train over the Baltimore, Ohio and Southwestern Railroad, in Indiana, about November 19-22. This movement is the result of co-operation of the B. O. & S. W. R. R., Purdue Experiment Station and the Indiana State Horticultural Society. The train is to be equipped and operated by the B. O. & S. W. R. R., while the lecturers will be furnished by the experiment station and the State horticultural society. Stops of one hour will be made at all the important stations, and talks given on the various lines of work. That part of Southern Indiana through which the train will pass is especially adapted to fruit growing, and an effort will be made to point out ways by which the average farmer can profitably engage in the business. Along soil improvement lines, information will be given on the value and use of commercial fertilizers. In this connection the results of experiments conducted in Southern Indiana will be presented.

NATIONAL COMMISSION MEN.

The sixteenth annual meeting of the National League of Commission Merchants will be held at the De Soto hotel, Savannah, Ga., January 8th, 9th and 10th, 1908, for the election of officers and the transaction of any business that may come before the meeting.

An invitation is extended to the publishers of fruit and dairy produce papers, as well as to officers and members of all associations interested in, and to shippers of fruits, vegetables and dairy products, to attend and become acquainted with members.

A Christmas Suggestion by

About the best, all-around, most acceptable present you can make one is a Camera. We can supply you with anything from a big \$35.00 affair to a dandy little Brownie. You can trade as well by mail with us as you can over the counter. Send for a Catalogue.

2 yr. old field grown plants.
(Plant now for Spring blooming)

Cedro Nursery, Gilroy, Cal.

The Ornamental Garden

THIS MONTH.

THIS is a planting month. Many trees, shrubs, trees and seeds may be planted. Any bulbs not planted last month should be planted now. That is, excepting gladiolus or others of the class which may be planted nearly any month in the year. But freesias, narcissus, Japanese and Easter lilies, amarillis, etc., should be planted at once.

Roses may be reset now, unless it is the most tender varieties. Where roses have become dormant, cuttings may be made. Many roses root readily from cuttings and will grow and produce some bloom the first year. It is a satisfactory way of enjoying the rose garden where one is unable to buy the rooted plants in pots.

In sections where frost is not heavy, deciduous shrubs, evergreens and vines may be planted. Plant salvias, carnations.

Nearly all annuals may be planted; pansies, stocks, sweet peas, phlox, mignonette, candytuft, alyssum, cosmos, etc. Thoroughly protect tender stuff.

GLADIOLUS.

The large planting of gladiolus should probably be made in the springtime, but some which are taken up early may be planted at any time. In fact, they may be planted any month, but as they do so well during the hot months the spring planting is generally preferred.

It is to be hoped that you have procured enough bulbs so that you can experiment with them in a different way than by planting them all in a long, straight row. If you will mass a number of bulbs in columns of from five to nine, each color in a clump by itself, I am sure you will declare that the gladiolus is a much more satisfactory flower than you have heretofore found it.

The flowers lose their individuality when a great number of them are planted together in a long row; but when properly massed each different kind will not only show off well by itself, but will also add to the charms of its neighbors. Of course, when you have some especially choice varieties you may want to plant them by the back door, or by the front door, where you can keep an eye on them; but otherwise the different kinds look better when the colors are combined in picturesque harmony. A stake driven into the ground in the center of each clump will support the stalks, if tied to it with twine.

If you plant the bulbs in a row drive a stout stick at either end and string a wire or strong cord from one to the other. Then the spikes may be tied to this, where it passes in front of them, and they will be held gracefully, but firmly in place. Plant the bulbs about four inches underground. They can be planted nearer together in masses than otherwise—about three or four inches apart, according to the size of the bulbs. The ground should always be rich and mellow. Do not expect the gladiolus or any similar plant to do its best in poor, worn out or badly drained soil. Water, mulch and attention should be frequently and thoroughly given.

PHLOX SUBULATA.

The old time favorite, known as moss pink, never seemed more lovely than when I found it in full bloom in a rural cemetery. So thickly did the plants carpet the ground it was impossible to step without crushing them, and the rosy pink blossoms beautifully adorned the last resting place of the sleepers. Some fond hearts years ago planted the pretty flowers in the old part of the cemetery, and there they now reign supreme. Friends no longer come to adorn the graves, but the little phlox makes them all beautiful.

I know of no prettier plant for the cemetery, and it is equally attractive in the garden where an edging is desired. Several distinct varieties are now obtainable. Alba, with pure white blossoms, makes a pretty contrast to the pink variety. The Bride and Nelson have white flowers with dark markings around the center, and the Vivid is a beautiful bright shade of pink. The Bride produces a mass of blossoms which cover the plant so completely that no foliage shows.

All these varieties are perfectly hardy, even in exposed situations, and all are easy of cultivation. When grown in a mass they are very showy.

HAVE A HOBBY.

It is usual for a man while carrying on his regular business to seek some relaxation from the daily routine. He becomes interested in some scientific problem or branch of work entirely outside his own profession in which he finds rest and recreation. So he leaves the main track for a run over the branch line, landing among his favorite haunts cultivating a hobby.

My little hobby has been growing bulbs, and they have had a special interest for me, ever since I was rambling over the foothills and valleys in search of the wild ones.

CANNAS.

Cannas are deserving of general planting, especially with the gardener who cannot give best and constant care to the more tender plants. The canna will stand neglect and yet give a color to the garden which few others will. Especially is this the case with scarlet low-growing ones, which all the summer through insist on showing a mass of red against the dark green leaves, which makes a beautiful contrast.

Stools may be divided now; in fact, at most any time of the year.

Coleus in red, brown or yellow lend a color relief, and they can be kept cut down to any desired size. The coleus does best in full sunshine.

The fuchsia is a grand subject for planting on the shady side of a house, or ferns can be used effectively on the north side. They always give a charming effect of coolness and retreat. A home nestled in ferns somehow is much more homelike than the same place would be set in glowing scarlet geraniums.

In preparing to plant care should be taken to dig the soil deeply and to give a supply of well rotted manure if it be available.

In addition to a well-executed general planting plan the successful development of a place depends on the preparation and fertilization of the soil, the pruning and planting of trees and shrubs, and the making and maintenance of a greensward.

LILLY'S BEST NORTHERN GROWN SEEDS

The Vegetable Garden

THIS MONTH.

THE hardier vegetables may now be planted and every garden should be supplied with these economical and desirable additions to the table: Plant peas, carrots, turnips, radish, beets, spinach, Swiss chard, onions, lettuce, leeks, rhubarb, kale, collards, cabbage, etc. Also get ground in condition for a succession next month. Spading in deeply well-rooted manure and allowing land to stand a few weeks will put it in fine condition for later planting.

FERTILIZER FOR TOMATOES.

In conclusions deduced from experiments at the Idaho experiment station we note:

Plants treated either with nitrate soda in most cases with sulphate of iron gained nothing the first year earliness over those untreated, whether pinched or unpinched, nor in total production of fruit for the three pickings. The number of rotten tomatoes was greater where sulphate of iron was used. In every case the unpinched plants gained in earliness over those pinched. The apparent lack of results from the use of fertilizers is believed to be due to the fact that the ground was already rich enough in natural food elements. In general, the results of the experiment are summarized as follows: Fertilizing good ground in Idaho seems unnecessary. Pinched plants grew fewer tomatoes than the unpinched plants. Sparks Earliana out-yielded all others in earliness and amount of yield for three pickings, followed by Nolte Earliest, Maule Earliest and Idaho.

The experiments for western blight were continued, particular attention being paid to water, manures and shading from sun and wind. On the evidence secured, the opinion is given that good plants set in good soil, well watered, and above all protected from the hot sun and heavy winds, will not blight very much.

POTATO SPRAYING EXPERIMENT.

In order to determine the actual loss under ordinary farm conditions spraying experiments have been carried on for the past three years in the principal potato-growing counties of Wisconsin. In 1905 experiments were conducted on 3 areas of 10 acres each in which 5 applications of Bordeaux mixture were sprayed at a cost of \$3.70 per acre, the net gain in product ranging from \$15.50 to \$36 per acre. In 1906 another series of experiments was carried on in which the average gains on 4 fields expressed in yield per acre, the increase with 6 applications being 18.9, 47, 29 bu. per acre, respectively.

WATERING LETTUCE.

Experiments at the Wisconsin station were conducted with lettuce grown in greenhouses to determine the advantages of the delative value of subirrigation as compared with surface watering. Two crops of lettuce were grown. The first crop was harvested from January 15 to 31 and the second crop from April 2 to April 10. In summing up the results from both crops it was found that the surface watered bench yielded nearly 100 lbs. more lettuce than did the sub-irrigated bench, or a difference of ap-

proximately 600 lbs. for a house 20x100 feet. Judging from these results with proper care as large crops can be produced with surface watering is more than offset by the difficulties and cost connected with the subirrigation system. The relative effect of these two methods of watering on the control of rot has not yet been sufficiently studied to warrant a statement.

THE SUPERLATIVE RASPBERRY.

Regarding the Superlative Raspberry, of which a fine illustration appears on the first page of cover, we quote from the statement by its propagator, Mr. A. Mitting of Santa Cruz.

"Too much cannot be said in favor of the Superlative. It is a red, sweet, berry, three times as large as any other variety of raspberry to my knowledge, and is almost as large as the Red Logan in size. It is the largest cropper of any raspberry in cultivation, being a continuous bearer from May until November. On one cane at one time I counted 472 berries of different sizes. Just think of a sweet raspberry as large as the Logan and a continual cropper! Do you know what it means? It means there will be a greater demand than the supply of plants and fruit. Every nurseryman and fruit-grower will want heavy shipments for their own planting. In all my experience I never saw such an opportunity to make money,—besides giving satisfaction both to the buyer and seller on the Pacific Coast for years to come. The berry is firm and a good shipper. I received from the introducer in Europe last spring 5,000 plants, and those that lived, as they were three months on the road, gave an abundance of fruit all summer. I shall also receive 5,000 more plants in December."

A reader in the Canon City district wants to know if there is anything tangible in the business of propagating new strawberries and we will try to tell in a few words what we think about it. Strawberries do not come true to seed. Fifty or more plants may be raised from the seed found in a single berry. When these seedlings come into bearing no two will be exactly alike. Some of the plants will bear fruit very small in size and perhaps of inferior quality. Upon others the fruit will be very small but of excellent quality. Upon still other plants the fruit may be of large size but lacking in quality, firmness or other necessary characteristics. Some of the varieties that are best in quality will have fruit so soft that they cannot be shipped, hence they are worthless for market purposes. Other plants will bear fruit desirable in every respect but the plants will be unproductive. Finally, some plants will be admirably adapted for market use but upon trial elsewhere will be found of local adaptation only, the plants being productive only upon certain soils and in certain districts. Out of thousands of seedlings perhaps only one will become a standard market variety. It is probably impossible to secure a type that is cosmopolitan enough to be adapted equally well to all soils and localities. We personally know of but two men in Colorado who ever succeeded in producing a presentable variety and they are both dead.—Field and Farm.

AGRICULTURE KING.

Secretary of Agriculture James Wilson has completed his annual report for 1907. He makes a stupendous showing, unequalled by any previous year in the history of the American farmer. The report shows that the total product of the farms for 1907 is valued at \$7,412,000,000, and in stating this remarkable fact he calls attention to the still more amazing one that the farm sustains most of the great export movement, for while all the other products in export exceeded the imports by only \$2,500,000 in favor of this country, the farm products in export exceeded the imports by \$444,000,000. So, as the Secretary of Agriculture says in detailing the \$1,055,000,000 of exports: "The farm is the basis of all National prosperity."

The report notes but one failure in the various crops raised by the farmers, and that is in oats, which fell greatly below the average. There were small declines in wheat, tobacco, hops, flaxseed and buckwheat, counter-balanced by increases above the average in cotton, hay, barley, rye, rice and potatoes.

Corn heads the list with the total production of 2,552,732,000 bushels, valued at \$1,350,000,000, or 26 per cent above the average value of the previous five crops. Other productions of the farm come in the following order: Hay, \$660,000,000; cotton, \$650,000,000; poultry and eggs, \$600,000,000; wheat, \$500,000,000; oats, \$300,000,000; potatoes, \$190,000,000; dairy products, \$200,000,000; barley, \$115,000,000; alfalfa, \$100,000,000; sugar beets, \$45,000,000; tobacco, \$67,000,000; sugar cane, \$28,000,000; flaxseed, \$26,000,000; rye, \$23,000,000; rice, \$19,500,000; buckwheat, \$10,000,000; hops, \$5,000,000.

The report pays more attention to alfalfa than to any of the other products of the farm, for the reason, as the secretary states, that experiments are still being made in its cultivation. He says:

"Alfalfa, that extraordinary plant for producing wealth and doing wonders to farms, is occupying an important place in the plans of the Department of Agriculture, the experiment stations and the agricultural colleges. Through their efforts largely it has rapidly gained success in cultivation throughout a vast area. The value of the crop as hay this year is supposed to be \$100,000,000, and if the plans and efforts now under way to promote its extension receive a reasonable reward the value of the future crop will be several times the present amount."

Noting that the production of beet sugar this year is about 500,000 pounds more than last year's output, the Secretary says:

"The beet sugar industry has grown very rapidly during the past fifteen years. In 1902 the beet sugar factories turned out 13,460 short tons of refined sugar; in 1907 the estimated product reached 500,000 tons. So profitable has the growing of sugar beets proved that sugar beet farms of the medium sort increased in value \$42.49 per acre from 1900 to 1905, as determined by special investigation by the Department of Agriculture, or from \$99.47 per acre in 1900 to \$141.96 in 1905."

The Bureau of Soils, dwelling upon alkali land, has this to say, particularly of California:

"Demonstration experiments on all the various kinds of alkali land found in the arid West have shown that the farmer need no longer dread alkali, but that such land can be easily reclaimed and made productive. The alkali problem has been satisfactorily solved and is, in reality, not as serious as many of the soil problems confronted by the Eastern farmer. Special study of the viticultural soils in California has shown that there is a direct relation between the soil and the color, yield and commercial value of the grape; that there are large bodies of soil very well adapted to various kinds of grapes and that the grape industry can be greatly extended in many parts of California."

"Soil surveys and special study have shown that there are large areas of soils in California that are particularly suited to rice culture and that the introduction of this crop will prove a boon to farmers owning such land that has hitherto been held to be of low agricultural value."

In closing his remarkable resume of the products of the farm for 1907, Secretary Wilson congratulates the American farmer that in the grand total income from his crops, he finds himself in vastly better financial condition than ever and truly the ruler of the Nation, for he is its real financial king.

USE OF OLIVE OIL.

The olive has been applied for various medicinal purposes since old Rameses I held sway over his dark-skinned subjects in Northern Africa. In the days of ancient Rome the leaves and bark of the tree were used by the remarkable medical experts of that time to allay and cure violent attacks of intermittent fever, while the resinous gum which exuded from the tree in the hot season was used for many of the ills to which flesh is heir. The oil of the olive itself later was used by the Roman athletes to soothe their heated bodies after indulging in heroic attempts to break the early records for 100-yard dashes and putting the discus or shot. Then the oil of the wild olive was employed as an extraordinary panacea, guaranteed to stop the ravages of all ailments. Last of all, in more modern times, the women of our own day use the olive oil in the form of soap to beautify the complexion by softening the pores and nourishing the skin itself.—The Great West.

Many subscribers of the Cultivator will remember J. Fletcher Brown a solicitor for this paper. He has called upon many of our patrons, up and down the State and won the respect of all. While working for the Cultivator, at Healdsburg, on Monday, he died suddenly, his body being found in a peaceful pose in his bed Tuesday morning. Heart failure was doubtless the cause. Prior to his work for the Cultivator Rev. Mr. Brown was a minister of the gospel and was most highly esteemed by all.

Shop Talk

The circulation manager of the CULTIVATOR uses this little Shop Talk column each week for his announcement to the readers, and he wishes you to notice it each time. There are sure to be things of interest to you. Since taking off most of our traveling agents, we must do our talking through this column.

"There are very few readers who are sorry that they listened to the agent when they subscribed and are now more than willing to say a good word for the paper."

In our issue of November 14th we offered to new subscribers the balance of the year free. Many saw that and told friends to order. That is still in force, as is our next offer on the 21st which was the Christmas Offer in which old subscribers could make a present of a year's subscription to relatives and friends, and receive credit for three months on their own account. On this we expect many orders before Christmas, or any time until the end of the year. The order blank for this offer is to be found on page 554, so you can look it up.

Last week had to do with clubbing rates, about which we should receive many inquiries. Just write us for clubbing price on the CULTIVATOR with any magazine or papers you would like to have. For instance, note the following:

American Magazine	\$1.00
Scribners	3.00
Cultivator	1.00

Total \$5.00

ALL FOR \$4.00

Munsey	\$1.00
Review of Reviews	3.00
Cultivator	1.00

Total \$5.00

ALL FOR \$3.00

The World Today	\$1.50
Success	1.00
Cultivator	1.00

Total \$3.50

ALL FOR \$2.00

The above is with the supposition that you are now a CULTIVATOR subscriber and take this way of renewing. For new names we will make the price 10 cents less on any club.

So read the whole paper, but be sure and read this column and when you have an opportunity or your subscription is about to expire, take advantage of some of these offers.

To any who feel that they would like to act as an agent in their locality, will say that we would like to correspond with you. We are going to establish local agencies in California, Oregon and Arizona, and to such as can give reference and care to take time from their other work to make our collections and hustle new names for us, we will make an attractive offer. Write in and we will tell you about it.

RURAL CARRIERS AND GOOD ROADS.

The Rural Letter Carriers' Associations in several States have begun the agitation of the question of good roads among the people, with a view of educating the masses on the need of better highways throughout the States. We all agree that the rural carriers know a lot about bad roads for they travel them daily 313 times a year, in all kinds of weather. That is, where the route is a daily one, and they realize the difference between well made roads and roads that are not made at all.

In a recent convention of good roads advocates, one rural carrier voiced the sentiment of the country, it seems to us, very clearly, in the following instance:

"We need education along the line of systematic road building and the proper administration of our road funds; in fact, we need less politics and more brains, less play and more work, less guessing and more engineering, and we can soon travel on our roads instead of in the roads."

When this crisis is over, the bank depositor who has been denied his money will be looking for a place to deposit it in good farm land. Remember what we say, farm lands have increased in value by this financial flurry from \$5 to \$10 per acre all over the country.

Agricultural Notes of the Pacific Coast

Northern California

Watsonville claims a seedless squash.

Tomato season ended at Healdsburg last week.

Butte county olives are bringing \$50 to \$60 per ton.

Two cars of oranges are being shipped daily from Palermo, Butte county.

Grass Valley milk men have raised their price of retail milk to ten cents per quart.

Maywood Packing Company is running to its fullest capacity on ripe pickled olives.

Nearly every farming section of the State reports the pest of hobos to be very perplexing.

Grape planting in Mendocino county is receiving a greater impetus this year than for many seasons.

Improvement Club of Vacaville has organized to make war on weeds on vacant lots and road ways.

The Vacaville Reporter says that this has been the most profitable season in that section of the country.

Weaverville had a drop of the thermometer last week, Monday morning, when 20 degrees were registered.

The Winters cannery has been compelled to close because the cool weather has delayed the ripening of tomatoes.

Prices paid by the Humboldt creameries during November ranged between thirty-three and thirty-nine cents.

With only two to two and one-half cents offered for last year's hops it looks as if the hop market is pretty nearly a dead one.

In Mendocino county there are now over three thousand bales of last year's crop and five thousand bales of this year's crop.

The Butte county orange growers are expecting to receive at least \$400,000 from their shipment of six hundred cars of oranges.

One hop buyer in Healdsburg purchased fifteen hundred and forty-two bales of new hops at a price ranging near seven cents.

The report that the work would cease on the Central Irrigating canal in Colusa and Glenn counties is now said to be erroneous and work is continuing.

The apple shipping season at Sebastopol closed last week after a run of four months and ten days during which seventy thousand boxes were packed.

The total shipments of green fruits from Vacaville this year have been six hundred and forty-five carloads as against six hundred and seventeen last year and eight hundred and fifty for 1905.

The Sonoma county Grange served a fine feast and had a pleasant time at Bennett Valley last week. This Grange will hold quarterly meetings at Santa Rosa the third Wednesday during January, April, July and October.

Central California

Lindsay has an arbor club.

The Merced is being stocked with Rainbow trout.

Lindsay has shipped about one-third of her citrus output.

Louis Clark of Visalia netted \$450 per acre from his potatoes.

The San José Grange held appropriate Thanksgiving exercises.

The first oranges of Mt. Campbell, Fresno county, netted \$3 f.o.b.

Exeter is growing grapefruit twenty inches in circumference.

Fresno proposes to maintain a citrus fair during the entire month of December.

The Hanford Sentinel claims that Kings county will soon be "some" on olive production.

About three hundred cars of oranges were shipped up to the end of November from Lindsay.

The farmers at Hanford have formed a mutual telephone company with forty-five charter members.

The Morse Seed Company has sixteen hundred acres of land plowed near Gilroy, on their seed farms.

At one time in Lindsay packing-houses there were ninety-nine cars of oranges held awaiting cars for shipment.

Many of the raisin seeding plants of Fresno are closed and the men idle, and will not reopen until prospects are better.

It is estimated that over \$60,000 will be brought to Porterville, Lindsay and Exeter as the result of one trainload of oranges.

A big weir is being constructed by the Lemoore Canal and Irrigation Company. It is over two hundred and sixty-seven feet long.

One train of sixty-eight cars of oranges from the Porterville, Lindsay and Exeter section was shipped East by way of Ogden last week.

It is estimated that the plans on foot for irrigating the Salinas Valley will require an aggregate of over three and one-half millions.

The bean crop about Gilroy was lighter than usual this season, but the beans were harvested in good condition and brought good returns.

The Salinas Index says that the tonnage of beets passing through the factory there this year is only about one-third the capacity of the factory.

The San Jose Grange, at its recent meeting, discussed the peach borer and listened to a paper on that subject read by County Entomologist Morris.

Kings county fruit growers who sold their fruit before the recent flurry, but did not receive money for some time, are now feeling easier that payments are being made.

The famous Riverside Dairy and Stock Farm located on Rough and Ready Island, belonging to Pierce brothers, has been discontinued and the prize-winning stock disposed of.

A mass meeting of orange growers at Lindsay last week made an appeal to the Interstate Commerce Commission at Washington to investigate and afford relief if possible in the refrigerator car shortage.

Southern California

Riverside claims a seedless apple.

Ventura county nuts are all gathered.

Great increase of alfalfa in Perris is noted.

Orange shipping began at Highlands last week.

Orange has a Farmers' Protective Association.

Arlington Heights-oranges are being shipped to England.

Two new melon sheds are being constructed at Brawley.

Fullerton will receive \$200,000 from her walnut crop this season.

El Monte has a pumpkin which weighs exactly one-eight of a ton.

Erwindale claims strawberries five and one-half inches in circumference.

The irrigation season closed with the great Bear valley dam full to the brim.

The peanut and chili dryer destroyed by fire at Tustin will be rebuilt as soon as possible.

Riverside claims two pumpkins with the combined weight of two hundred and ninety pounds.

It is estimated that the citrus growers' share of last year's oranges will aggregate \$23,000,000.

Imperial Stock Breeders' Association will hold a colt show at El Centro the first week in December.

Redlands Golden Orange Association is endeavoring to secure white orange pickers and dispense with the Japs.

Oranges are turning in color quite rapidly and the output for the holiday trade will probably be quite large.

The tomato crop at Fullerton was injured by blight caused by the recent storm to the extent of over \$30,000.

Five hundred acres have been signed up for membership in a new cantaloupe-shipping organization at Imperial.

Prof. P. J. DeVries, engineer of public works of the Dutch Indies, is in Riverside investigating matters of irrigation.

The Imperial Valley creamery paid thirty-seven and one-fourth cents per pound for its butter fat delivered during October.

Rialto Orange and Lemon Growers' Association has signed up eight hundred and fifty acres of oranges for next year's output.

Tustin peanut men are in the midst of the harvest which has been found to be injured less by the early rains than at first anticipated.

Fruit growers near Lancaster have become exasperated because stock has been allowed to roam at large and are now engaged in impounding all stray animals.

Both the Thermal Cantaloupe Growers' Association and the Coachella Valley Producers' Association have signed contracts to market their melons through one Chicago firm.

The Oxnard sugar factory crushed one hundred and thirty-five thousand tons of beets this season. The average was eighteen per cent. The amount paid to the growers was nearly \$1,000,000.

The Coast

Potatoes and onions will bring Oregon a million dollars this year.

Farmers at Corvallis, Or., are planting larger areas of apples this fall.

Portland has raised \$52,000 to finance a live stock show next fall.

Thousands of acres are being reclaimed from the river at Newport, Wash.

The fall crop of strawberries at Wenatchee proved exceedingly profitable this year.

A half-million dollars will be received for fruit from the Coeur d'Alene, Idaho.

Dayton, Wash., has shipped twenty thousand boxes of apples to New York this season. •

The Montana Dairymen's Association will meet at Great Falls, December 17th and 18th.

Fall seeding of wheat is rapidly proceeding at Walla Walla, Wash., since the recent rain.

The Spokane Valley produces \$375,000 in fruits and vegetables entirely as a result of irrigation.

Yakima hay growers have been shipping alfalfa to British Columbia and finding a good market.

A Wenatchee farmer maintains that he can grow his potatoes at the tops instead of at the roots.

First snowstorm of the season raged during the last week of November in Davenport, Wash.

Great quantities of grain are stored at LaCrosse, Wash., which cannot be moved because of lack of funds.

Forest rangers of Idaho met at Delta recently and discussed rules and regulations promulgated by the service.

The recent wool growers' convention held at Dalles, Or., voted to hold the next convention next fall at Heppner.

A severe thunder shower visited Astoria, Or., last week, doing some little damage by burning barns and some hay.

A heavy rain at Pullman, Wash., during the last week in November has relieved the prolonged drought and stopped all farm work.

The fifteenth annual international convention of the Northwest Fruit Growers' Association is being held in Vancouver, B. C., this week.

One hundred and seventy sheep and cattle men met recently in Wenatchee, Wash., to secure allotments of grazing permits for 1908.

The turkey market at Portland, Or., took a severe slump immediately before Thanksgiving. The top notch reached was seventeen and one-half cents.

A large number of farmers in Northern Idaho have banded themselves together to beat the warehouse trust and are building their own warehouses.

Large pumping engines are now being installed at Miles, Wash., by the Spokane River Land and Development Company. The plant will cost about \$7000.

The car shortage at Walla Walla, Wash., which was so embarrassing in the moving of crops has been relieved only to find the money shortage still more perplexing.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co., Indiana and Yolo Sts., San Francisco, Cal.

Also Pioneer Manufacturers of High Grade Fertilizers.

Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

FOR THE BEGINNER.

WE receive many letters from our readers asking for information as to construction and arrangement of yards. So will give a short article which may be of some interest to the novice in poultry culture under California conditions. We will consider the arrangement and maintenance of yards and houses.

Now, as the money market is tightening up and there is a tendency to stop speculating in real estate, stocks and mines, we find many, who heretofore had taken little interest in poultry, either from a commercial or fancy standpoint, seeking information along lines pertaining to utilizing the city lot or small ranch for breeding either commercial or fancy poultry.

Soil Conditions.

Let us first consider our land, upon which we expect to locate our houses and yards. If we have to acquire them, we should look for two things; first, the cost, and second, the nature of the soil.

If we have not already our land we should select a sandy loam which is always better than a clay or "dobe."

If you expect to make a living from poultry and devote all your time to its culture, you should have sufficient land to accommodate from 1000 to 1500 birds. In figuring the land and yards for our stock we will give as an example a successful plant situated near Los Angeles, which is neither a cheap, nor an expensive one, so far as houses and yards are concerned.

How Many Per Acre.

The yards are 25x48 feet with a four-foot alley between which uses equal to 25x50 feet of land for each yard. Figuring on the basis, we are able to get forty-three yards to an acre. This, with twenty head to each yard, will give us 860 hens to an acre. According to this, it will be necessary for us—if we are to have 1500 hens, about three acres, as a part will be used for young stock and your feed houses, incubator and brooder house, etc.

The houses on this place were built of shake, with gable roof and no floor, but set up from ground about eighteen inches. These houses were built several years ago and cost, not including labor, about \$2.50 each, size 4x8 feet. The cost will now be some greater as the price of lumber has advanced. The pens were enclosed with five-foot poultry netting and cost about \$5.50 for wire, posts, etc.

Stock and Profit.

The stock kept on this ranch are pure bred White Leghorns and show a clear profit of \$2.25 per hen after allowing \$1.12 per head for feed.

The feed for this ranch was purchased in large quantities, often by the carload, which is an advantage over buying by the 100 pounds.

We should be trying to find out not in what we differ from other people, but in what we agree with them.—Ruskin.

SANTA ANA SHOW.

The Santa Ana Poultry Association gave its first annual show Nov. 25 to 30 inclusive in the opera house block, Santa Ana. It was a success, and a very creditable display of fowls.

The association worked under very discouraging conditions, as the merchants of Santa Ana gave them no encouragement at all. This caused some of the more timid ones to get discouraged, and they left the work all on a few members who, however, proved equal to the occasion and by hard work pulled off a show that is a credit to the boys.

The association rented coops from the Poultry Breeders' Society, likewise its superintendent, Mr. C. Andrews, who very ably cooped and superintended the show.

The largest class in the show was White Rocks, which contained some very good specimens, especially in pullets, the first and second pullet being good. The cocks were also a good class. The Rhode Island Reds was the next strongest class in the show with some extra choice breeds. The first prize cockerel was as good a bird as we have seen at a Coast show. He was splendid in color and good shape, though we thought him a little high on legs and a trifle short in body, otherwise he was a typical specimen and by far the best bird in the class. White Wyandottes, though not a large class, contained some good specimens.

Many of the birds were handicapped by not being up to weight, as at this season it is hard to get them to take on weight. This being a score card show the usual delay was caused in getting the ribbons in place. It is always tiresome to have the show drag through the whole week before the prizes are announced.

We are sorry that we are unable to give a full list of the awards, but when we left were unable to get a full list. Taken as a whole the show ought to encourage the fanciers, as they have the birds and the right spirit. We hope that next year they will have even a larger show than this one.

PETALUMA POULTRY SHOW.

Petaluma, after a number of years, will again have a poultry show, to be held there on December 17th to 21st. The advantages of a poultry show in Petaluma are so many and so obvious, that it is wonderful so many years have gone by since they last held one. It is so long that a great number of poultrymen there have never had the opportunity of seeing a poultry show in their own town. One of the results of this is, that while there are enormous quantities of chickens in Petaluma, there are very few fancy chicken raisers.

With the coming poultry show we predict that this condition of affairs will be changed. The fanciers who show will do an enormous business with the Petaluma poultrymen, both in eggs and stock. Therefore, send

When writing advertisers mention Cultivator

your best birds, and plenty of them.

The judges for the show are Mr. Henry Berrar, of San Jose, and Mr. R. J. Venn, of Fresno, both well-known men, who need no commendation. The premium list has many new and attractive features; firstly, the liberal cash prizes offered, as well as numerous valuable cups. These cups are so offered as to give an opportunity to every breed. As well as the regular classes, there are selling classes, local novice classes and classes for pigeons and a class for eggs.

People, locally, are taking a great deal of interest in the local classes and in the class for eggs, and with the numerous fanciers who have promised to support the show, the Petaluma Poultry Keepers' Association anticipate a very successful meeting.

Any one wishing further information as to entries, etc., can obtain same on application to F. W. Stratton, Show Secretary, Petaluma.

THE START.

As a rule there are two extremes in all kinds of business and the poultry business is certainly no exception to the rule. If you are totally inexperienced and think all you need is to buy a half-dozen incubators and brooders and run them according to directions and get rich in a year or two, be at once undeceived or you will undoubtedly be disappointed. A great many beginners try to raise a thousand or two birds their first season, and if they only get dozens instead of hundreds they think there is nothing in it and give up in disgust the first year. This is one extreme. If you have no ambition to try to do anything and go into the business in a half-hearted way and do not try to get something the first year and all other succeeding years you are following the other extreme and will not be any more likely to succeed than the other way. My advice would be to go a little slow at first till you learn the business and then follow it up as fast as you can and spread out as fast as your profits will justify you in doing. Get a few good old tried and true hens for incubators and brooders the first year, take care of them and let them hatch and take care of the chickens, then learn to handle chickens, buy incubators and brooders, and learn to handle them; they all pay — chickens, incubators, and brooders, when properly handled.—S. W. Stockman.

FEATHERS.

Have patience and do your work well.

Helter-skelter methods mean bad results.

Good management brings success more than any one thing.

Mistakes if profited by often prove blessings in disguise.

Patience is a strong link in successful poultry raising. Try it once.

Look out for lice on the young turkey poults.

In fattening turkeys do not feed the ones you keep for breeding or those too young to fatten as you do the ones intended for market. It will be injurious to them if you do.

Cull out all undesirable hens and send to market now.

Gather leaves and store for that scratching pen.

is the one which contributes 150 eggs or more in a year, toward the family grocery bill. The sure way to have such hens, eggs in abundance, and a lot of ready cash, is to give a little of

DR. HESS POULTRY PAN-A-CE-A

with the morning feed every day in the year. Dr. Hess Poultry Pan-a-ce-a is a tonic, the sole purpose and action of which, is to assist nature in the performance of necessary functions. It aids digestion, prevents disease, and sends the proper proportion of each food element to the organ most in need. It also contains germicides which destroy bacteria, the usual cause of poultry disease. Poultry Pan-a-ce-a is the prescription of Dr. Hess (M. D., D. V. S.), and is a guaranteed egg-producer. Endorsed by leading poultry associations in United States and Canada. **Sold on a written guarantee, and costs but a penny a day for 30 fowls.**

1 1-2 lbs. 35c; 5 lbs. 85c; 12 lbs. \$1.75. 25 lb. pail \$3.50.

50 Cent Eggs

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pall, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pall or sack freight prepaid by us.

HOW TO INDUCE FALL LAYING

A little care and additional work and attention with the hens on the place at this season will be well repaid. This is the beginning of the moulting or shedding season, and a good many of the hens are not laying and will not lay for some two or three months under the usual course of neglect and indifference on the part of their owners. And yet, it is possible to get a goodly number of fall eggs if we go at it right.

To induce fall laying, the hens should have a variety of foods—not a great deal of any one kind, but a little of several kinds. For this purpose all the waste of the kitchen and the dining-room should be saved and given to them. The best plan is to have a good-sized pot handy, and throw all scraps into it. Let it sit at the back of the kitchen stove, and at the close of either the breakfast or midday meal, put some oats or wheat into it, with water, and soak all together. It will not take long to do it and then when cooled off some call up the hens and give it to them. It will start them to singing and running about in a happy way, and soon start them to the nest, and keep them laying all through the autumn and fall.

In addition to the eggs this system will bring, it will also keep the hens healthy and vigorous and enable them to shed and re-clothe themselves in new feathers earlier than otherwise.—Rocky Mountain Husbandman.

THE SECRET OUT.

We recently learned the secret of the success of Petaluma as an egg-producing community. It accidentally leaked out through Henry Albers Co., of this city, when they secured an order for 3500 pounds of Lees' egg-maker. This was followed by a hurry up order for 200 palls weighing 25 pounds each. The wise folk from the north know a thing or two when eggs are high.

Your Poultry Require

LILLY'S BEST POULTRY TONIC

Strengthens the digestive organs, tones up the system, stimulates growth, purifies the blood and greatly increases the production of eggs.

After trial of your Poultry Tonic my egg yield doubled in number, and am so well pleased that I have ordered my grocer to keep it on hand always for me. I deem it indispensable.

TO ENGRAVE EGGSHELLS.

Make the drawing of any figure or design you please upon the egg in melted tallow or any thick oil. Then immerse the egg in strong vinegar. When the egg has remained for some time in the vinegar it will be found that the parts untouched by the tallow have been eaten away, leaving the design in relief.—St. Louis Globe-Democrat.

Irrigation and Forestry

DIVISION OF THE WORK.

IN VIEW of the fact that Dr. Elwood Mead has been called to Australia to assume direction under government auspices of irrigation work in that country, the secretary of agriculture has divided the work of Irrigation and Drainage Investigations of the Office of Experiment Stations, which Dr. Mead has managed with such marked ability since its establishment in 1898, into two sections. Dr. Samuel Fortier, irrigation engineer in charge of the Pacific district of the Irrigation and Drainage Investigations, and stationed at the University of California, Berkeley, Cal., has been made Chief of Irrigation Investigations. Mr. C. G. Elliot, for several years past engineer in charge of the drainage investigations of the office, has been made Chief of Drainage Investigations. Both of these offices will report directly to Dr. A. C. True, director of the Office of Experiment Stations.

In the irrigation division the three main lines of work will be, as heretofore, dissemination of practical information; scientific and technical investigations and reporting on irrigation conditions in certain districts.

In view of the fact that probably about 5,000,000 acres of land provided with water for irrigation will be available for settlement at the close of 1908, it is believed that in no other way can more good be done than in supplying practical information through publications and expert advice to the new settlers on this land, and it is, therefore, deemed advisable to broaden the scope of this work so as to make it valuable to every class of farmers dependent upon irrigation and to every project whether public or private.

The scientific and technical investigations will be a continuation and extension of what has already been done. Prominent features of the work will be to determine what becomes of the large quantity of water which is annually spread over cropped soils, involving a study of evaporation, seepage and distribution losses, with a view to securing higher economy in the use of water; there-

lation of irrigation water to quantity and quality of crop and the adaption of methods to different soils and crops; and a study of the more technical features of the measurement, conveyance, storage and distribution of water on farms, and the various devices used for pumping.

In the study of irrigation conditions in different localities is to be laid especially on possible improvements of present methods which will lead to a more economical use of water.

The drainage work is to be developed along the following lines already well established: The examination and study of past and current drainage practice with reference to the success or failure of various methods and their use in solving such problems in localities where drainage is an important factor in agriculture. Also the collection and systematic arrangement of known principles and current practice relating to the subject, for the better information of agricultural engineers and others upon whom the planning and carrying out of drainage works devolve.

Also assisting farmers, communities and States in the initiation and direction of drainage improvements.

Furthering the examination and investigation of the more technical problems pertaining to land drainage concerning which there is a lack of information, including investigations to determine the drainage co-efficient of agricultural lands, plans for draining muck lands which border on peat formation, movement and behavior of water in irrigated land, methods of testing cement drain tile, the laws of erosion of ditches and of the sedimentation of ditches and similar questions.

During the past year plans for the drainage of about 2,000,000 acres, principally in States east of the Mississippi river, have been made in the office.

The irrigation and drainage investigations of the Office of Experiment Stations are largely carried on in co-operation with the State experiment stations and the State governments. Several States have made appropri-

tions for this work to supplement the Federal funds.

The irrigation and drainage work of the Office of Experiment Stations is entirely distinct from and supplementary to that of the Reclamation Service of the Interior Department, and does not involve the construction of irrigation works, but rather the study of problems connected with irrigation systems already in use and the giving of advice and aid to farmers.

AMERICAN FORESTRY ASSOCIATION.

The American Forestry Association of Washington, D. C., was organized in 1882, and incorporated in January, 1897.

The object of the association is to promote the preservation by wise use, and the extension of the forests of the United States; it seeks to encourage the application of forestry by private owners to forest holding, and it favors the establishment and multiplication of National and State forests, to be administered in the highest interests of all.

From the beginning the association has stood for practical results. The enactment, in 1891, of the law whereby the president of the United States was authorized to establish, by proclamation, National forest reserves on the public domain, was largely due to its efforts. As National Forests, these "reserves" now constitute an area greater than France or Germany, and equal to that of all the States north of North Carolina and east of Ohio.

Not content with past achievements, the association aspires to increased usefulness. Almost all our National forests are in the far West; others are imperatively needed in the East, notably in the White and Southern Appalachian Mountains. There being no public lands in the East, these forests cannot be "proclaimed; they must be created by congressional enactment. The association is bending its energies to secure such legislation.

That the association may successfully prosecute its work, it needs a larger membership. Its membership now numbers more than 6400, and is found in every State of the Union, in Canada and in foreign countries. Can this be increased to 25,000? It will materially add to the effective-

SMALL FARM MOVEMENT.

How great a revolution has been worked by irrigation in the West is shown in an investigation just completed, covering San Joaquin county, and applying to the whole central valley. In 1900 this county had 1966 farms, averaging 440 acres to a farm. Today the average has dropped to 208 acres, but that does not tell the statistician's whole story. For against 98 farms of less than ten acres in 1900, there are now 362 of this size and 689 farms of less than 20 acres.

Here in a locality where a few years ago farming was on a vast scale, there are now 127 profitable farms of less than three acres each, and 362 less than ten acres. This change is due principally to irrigation, and the subdivision of farming lands into small tracts has brought about an era of intensified and diversified agriculture, resulting in much higher land values, more valuable products and amounting to an insurance against general crop failures. The small farmer pursues more scientific methods of culture and gets so much greater profit per acre from his holdings than the old-style farmer ever received, that he can gain a good living from a very small parcel of land.

This change to small holdings also has the important result of multiplying settlers, for each needs but little capital. What land is required can be bought on time. In a few months the settler is established and within a year has an income from his own property. The profit it is possible for the small farmer to reap in this State explains a mystery of how California can absorb colonists arriving as they did in September, at the rate of 10,000 a month.

THE MAN.

Give me the man who can hold on when others let go; who pushes ahead when others turn back; who stiffens up when others weaken; who advances when others retreat; who knows no such word as "can't" or "give up;" and I will show you a man who will win in the end, no matter what opposes him, no matter what obstacles confront him.

The olive is one of the principal crops of Maywood Colony section.

ADDRESS _____

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Congestion of Brain.

I have a hen that has something the matter with her legs that I am at a loss to know. About a week ago I noticed she acted peculiar in walking. Apt to step sideways or backward as ahead. She grew worse till now she can't use them at all and lies around on her side; by kicking and by flopping her wings can navigate a little. Otherwise, she is perfectly healthy, eats as hearty as any hen. My fowls are all healthy; haven't had one die in the past year.—J. C. C., Santa Barbara.

The trouble is congestion of the brain, and may be caused by over-fat condition or may result from fright, indigestion or by intestinal worms. Treatment: Apply cold water to the head till it is thoroughly cool. Keep the bird in a cool place. Give a dose of two teaspoons of castor oil, and feed principally green food. Give three grains of Bromide of Potassium three times a day, dissolved in a tablespoonful of water.

Plague of Ants.

Will you please publish the following in your valuable paper, to wit:

Will someone kindly tell me what is the best and most effective means of destroying ants in the open field where they have become a menace to trees and plants. The ants which are bothering me and a great many others in this part of the country are small sugar ants, and they infest almost every tree in my grove, work into the new growth on the trees, and sometimes on the harder and more mature portions of the trees, causing a gum to exude therefrom. They are fierce and sting hard. They have made it their business in my pineapple patch to carry and distribute the mealy bug, and sometimes undermine and destroy large pineapple plants and even trees. They are not generally as bad here as they have become on my place during the last two or three months. They seem to have increased since I gathered a crop of corn from among my young trees.—C. R. Newton, San Juan, P. R.

We have never had experience with a case where ants have become such a pest as described by Mr. Newton. Ordinarily we would say use plenty of good California Buhach which will rid a house of them quickly. Whether it could be used in extensive field operations economically we doubt.

Another remedy said to work admirably by one who has tried it on ant hills in lawns, is to mix a heaping teaspoon of powdered strychnine in a pint of sugar. Moisten slightly and spread over top of the hill. The ants carry it down into the holes and in time all disappear.

Let care be exercised that children do not have access to this for it is a deadly poison.

Any suggestions our subscribers may have will be appreciated.

Front Feet in Hole.

Is it good for horses to stand with front quarters lower than the hind quarters when they dig a hollow next the manger by stamping with their feet?—L. L. K.

No. Every animal is more comfortable to stand squarely on its feet as the Creator intended them to do. I have had to stand sick animals

in such positions and they always seemed uncomfortable. I believe every discomfort an animal is subjected to means in the end loss of feed. We know in man that hardships do not strengthen the physical side. Lately, we are beginning to think they do not add to mental strength. If we believe in a God of love we cannot think that he subjects us to discomfort to make us better people.—M. E. S.

Syrup for Stock.

I see frequently in the papers about feeding syrup to stock quoted at \$1.25 per barrel. Where can syrup be bought at that price? Do you recommend it for stock food? Can you give me the address of the briquette factory. I find the Cultivator a very valuable aid and file it away for reference.—W. C. B., Arbuckle Cal.

We do not know as to quotations, but think you can get information by writing your nearest sugar factory which would be, in your case, we think, Hamilton City. Syrup is generally conceded to be an excellent stock food.

If by briquette factory you mean the factory which puts up the briquettes for frost protection, we would refer you to Geo. Griffith, 1130 S. Broadway, Los Angeles.

For the fuel briquettes, your nearest gas company can probably give you information. They are manufactured by the L. A. Gas Co. Also the Tesla Coal Co. manufactures them. Think their address is Stockton.

Weak Legs.

I have a sow heavy with pigs, who has a weakness of the hind legs and hips. Kindly advise through your paper as to cause and how to treat her.—F. F. W.

This is a defect in breeding too fine. Put the sow on a board floor with plenty of bedding under her. Put on the side boards of the pen to prevent her from overlying the pigs when they come. After she raises her pigs fatten her off for pork. I would not use her offspring for breeders as they are likely to have the same physical defects. I am not giving you any medicine for the sow, as a sow is rather dangerous to dope as the pigs are apt to be lost. The young pigs can be fed on ground bone and lime sulphur, iron, charcoal mixture after they are weaned, in hopes of making their bones harder.—M. E. S.

Warts.

My heifer of 21 months has a wart on back teat that is enlarging; is now as large as a small hickory nut. Not hard, and gives no discomfort to cow, but stains the palms of my hands at every milking with blood. Should it continue to enlarge, it might prohibit milking. Am feeding one broken green watermelon night and one in morning with one quart of bran. Is that amount of bran enough? Do the melon seeds dry the milk? Two flakes of alfalfa a day.—E. D., Redlands.

Twenty-one months old and in a milking string! Surely, this is child labor! It does not seem that

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

the milk can have the vitalizing quality as human food when from so young and undeveloped an animal. It is not wise to have a heifer come in to milking as early as this, not wise for the health and development of the future cow, nor wise from an economic point of view, as the cow will first add to her own stature before she gives up the substance of the food to the milk pail. Heavy feeding is all that can save the milk for the pail. This heifer must be running on grass or else she would starve on the food given to her. Watermelons are over 95 per cent water. Their value lies in the succulency that they add to the other food, rather than in themselves directly. Seeds are not regarded as injurious to milk flow.

The excrescences we call warts are always hard. I think that this being a soft tumor and given to bleeding it should be cut out by a veterinary and then the spot cauterized. A milking tube will have to be used until the place heals over.—M. E. S.

Feed for Calf.

I have a two-months-old calf; she has been fed on a mush made of oil cake meal, shorts and feed meal, cooked. I put a pint of that in a gallon of skimmed milk three times a day; she eats hay, sweet potatoes and grass now. What I want to know is how much longer I will have to continue cooking the mush for her, and how much longer she will have to have the milk.

Gradually reduce the amount of milk used by adding hot water to the mush. In two weeks the amount can be all hot water, and then gradually thin out the mush. Put some of the same mixture used for the mush, uncooked, dry in a little box, salting with a teaspoonful of salt to each quart. Watch the calf and do not allow it to fall off in condition. If it does, add a little more of the mush in the hot water. At four months old it should be eating well of the dry mash and grass without other feeding. At once begin to feed only twice a day. All these changes must be made with care and slowly, but they soon work out the problem.—M. E. S.

Losing Milk.

We have a large Jersey cow which I think is not giving as much milk as she might if properly fed. We have fed her on good alfalfa hay, with about six quarts of bran and a quart of cracked corn per day. She has all the hay she will eat and is allowed to nibble at growing barley, too. When fresh in July she gave sixteen quarts per day. Now she scarcely gives twelve. Can you give me a balanced ration for her? I mean of the grains we have. Would oilcake meal be good for her? She has an unnatural craving for something; she will eat rags or ropes. What can I do to cure this? She has been well, and is in good shape, as to flesh.—Mrs. S.

Feed is sufficient. If the bran was made into a heavy slop with warm water well salted, it will often increase the milk flow. A good blanket at night if she is out of doors will help to hold up the milk in quantity. Habit has much to do with a cow drying off early, and if you persist in securing every drop of milk in her udder, the next time she freshens the results will be increased length of milk period. The cow does not need oil cake if she is dropping off in milk and holding her condition. The craving is for roughage; a few cornstalks would satisfy that, or, if not available, give her a tablespoonful of ground bone in her feed. Put a little slaked lime or plaster

with salt in a box for her to nibble on. It is the familiar slate-pencil appetite of our childhood days showing up in the cow.—M. E. S.

Yeast Treatment.

In your paper of Nov. 7, "Trouble with Cows," is an article on yeast treatment. I have a mare that has been served five times with no results, while she appears to be in proper condition, and I feel her the best of four of my working mares served the same time with good results. Could the yeast treatment be effectively applied in this case?—C. J. M.

Yes. The yeast treatment will cure about sixty per cent of the cases, where there are no lesions. Artificial impregnation is also nearly sure to remedy these cases. Many mares can be brought out of this trouble by putting them on hard grain feed and working them down to racing condition. Overfat, internally, is often a cause of barrenness.

Budding Peaches.

I planted some peaches last April which came up fairly well, but I did not get them budded this summer. What would be the best to do with them if I can bud them the coming spring to advantage.—L. Jacobsen, Selma.

Select bud sticks from this summer's growth and place in slightly damp sand and in a cool place, till the young trees begin to grow in the spring. You can't bud till the bark slips. Cut your bud sticks after mid-winter and before there is a flow of sap that will swell the buds. If you do not have any luck with them, you will have to wait till June or such time as the new growth of peach wood is ripe enough to use buds from. This is when there is fiber enough in the wood to prevent its being brittle. These instructions refer to budding under the bark. Peach trees may be budded before the bark slips by using buds from large scions. The bud is cut from the top down just as a bud is cut from a scion for the purpose of inserting it under the bark, and a cut of the same approximate size is made on the stock, only the piece of bark is not removed, but left attached at the bottom like a hinge. Place the bud under this so that the inner barks will come together and bring the flap of bark up over it and tie with waxed cloth. This is known as winter budding and may be done late in the winter or early spring before the sap starts.—J. W. M.

Grafting Apple and Plum Trees.

Please tell me how to graft on apple and plum trees and when?

Also how to bud on old stock. I am a beginner in horticulture and need this information.—J. M. M., Tropic.

About the time the blossom buds begin to swell so as to show color, cut off the branches and put in a cleft in each branch. If the branches are over two inches in diameter, put one on each side of the stump. A cleft graft is made by splitting the stump and inserting a wedge-shaped scion that will fit snugly when in place. Always have the inside barks mated, that is, come even. The bark on the stump will be thicker than that of the scion and this will make the outer barks uneven. This makes no difference. Make a grafting wax of four parts rosin, two parts beeswax and one part tallow. Boil together till well mixed. Dip rags into this while boiling and tear into strips about three quarters of an inch wide. Wrap these around the stumps and over the top

so as to cover all the cracks that are made by putting in the graft. Have some wax hot and paint over with hot wax so as to stop up all pores. Another way is to paint the stumps and points of union with the hot wax, wrap with cloth and wax again.—J. W. M.

Alfalfa Tainted Milk.

Will you kindly give me some information I have never seen discussed about—alfalfa. Many people here object to feeding alfalfa hay to milch cows, saying it imparts a bitter flavor to the milk and butter. I have had the experience myself, have had both milk and butter so strong that it was unfit for use while feeding alfalfa hay. Could that have been the cause? If so, is there a remedy?—W. E. Yeaw, Washington, Nevada Co.

The claim has been advanced since the introduction of alfalfa. The best feeders continue to use it. The query has been sent to Mrs. Sherman who will answer it.

Government Land.

Please tell me how I can get information in regard to government land for settlement, homestead or otherwise.—S. S.

The U. S. Land Office at the corner of Spring and Market streets, Los Angeles, is headquarters for information as to land in Southern California, as is the San Francisco office for Central and Northern California.

Of course, those offices will not undertake to locate any one, neither will they give very much general information. Attorneys and civil engineers sometimes make a business of locating desirable claims. For instance, we are informed that one firm now in Los Angeles offer to locate one on what they claim to be a fine quarter section for a fee of \$125.

Dates.

I have a 'date palm in front yard which has three bunches of dates. Will they mature in this climate, and do they need any protection from cold? A Subscriber, Ceres.

If the dates do not ripen before frost they will not ripen at all. If they become nearly ripe, there is a chance for them to ripen another year. If you can bring the tree into bloom by early irrigation and fertilization, it will give a longer season in which to ripen. Dates are influenced in this way by early irrigation in dry countries. If the bunches ripen a few dates, many of the remaining ones may be ripened in an incubator. Cut the entire bunch from the tree with all the stem. Keep the temperature a little above 100 degrees.—J. W. M.

Black Fungus in Oranges.

I should like to have your opinion as to the advisability of picking up and burning the oranges with the black navels which drop from the trees. If the black spot comes from the sting of an insect, would the worm go into the ground, as I am informed it does with some deciduous fruits, and come out another season, in the form of a fly, to sting again? If you will kindly give me your views on this subject you will oblige Mrs. F. A. F., East Highlands.

The black spot does not come from a sting and it is not worth while picking up the infected oranges. The spores that cause that disease grow on many different things.—J. W. M.

In Heat.

I have a cow 10 or 11 years old that is in heat all the time; has been for the last two months or more; has been served four times, first time September third; would take service every day and a dozen times a day if allowed to; worries the other

cows all the time; what can I do for her?—J. S. M.

Give this cow iodide potassium; one dram night and morning in feed for a week. This will probably have desired effect. If not, it may be necessary to open the neck of the womb and dilate with an instrument for the purpose.—W. J. Oliver.

Black Scale Spray.

Please give spray suitable for black scale.—Subscriber, Arroyo Grande.

If only a few trees about the house, a strong suds in which a little coal oil is added and churned together will rid your trees of the scale. If you wish to work in a larger way and have a machine with agitator, spray with 28-degree distillate (not stove distillate, but especially prepared) spray. Mix two gallons to 100 gallons of water.

Paspalum.

Please tell me through your paper, when and how to sow or plant paspalum grass seed, when you wish to grow it for seed, including how much seed per acre, etc. I have a small amount of seed and I wish to use it to advantage.—C. C. E.

The best information may be had by writing the State University at Berkeley, where it has been experimented with for several years.

Ayrshires.

I noticed in a recent issue that you wanted to know where any Ayrshire stock could be found. I may state that I have some, a thoroughbred cow and two bulls. I have also two beautiful heifer calves.—Thomas F. Leslie, Santa Barbara.

Fermentation.

Why is a cow fed on green alfalfa and bran subject to bloating and foul breath.

Stomach fermentation or sourness. Add a teaspoonful of baking soda to the bran, as a corrective of the acidity.—M. E. S.

Bordeaux.

Will you please give me in your next issue the recipe for the Bordeaux spray for peach trees. Is now a good time to prune peach trees? A. M. M., Redlands.

There are many formulas for Bordeaux. That is, varying amounts of the copper and lime. But for winter wash the following is good:

Bordeaux is a combination of lime and bluestone (copper sulphate.) The active or efficient portion of the spray is the copper it contains. The copper in the Bordeaux mixture is in the form of a slowly soluble compound which is more or less dissolved by dews and rains. This dilute solution of copper is very poisonous to fungus parasites, but when rightly prepared and applied does not injure plants. For these reasons the Bordeaux mixture is the best general remedy for fungus diseases known.

Preparation.—For winter use the Bordeaux mixture should be prepared stronger than for the summer applications. A good general formula would be:

Bluestone 7 pounds
Lime 6 pounds
Water 50 gallons

First, dissolve the bluestone. This is readily done by suspending the bluestone in a sack in a barrel of water. The barrel should be filled nearly full of water, and the sack containing the bluestone suspended as near the surface as possible. In this way 50 pounds of bluestone can be dissolved in a barrel of water in a few hours. If enough barrels are

Did You Ever Hear of an Offer Like This?

Useful and Beautiful

No other firm could afford this but us

This is the first time we have ever made this offer—this beautiful 4-piece set of Silverware (guaranteed;) full size for family use packed in case,

THE VALUE OF A SMILE.

The thing that goes the farthest toward making life worth while, That costs the least and does the most, is a pleasant smile. The smile that bubbles from a heart that loves its fellow men Will drive away the clouds of gloom and coax the sun again. It's full of worth and goodness, too, with manly kindness blent— It's worth a million dollars and it doesn't cost a cent.

There is no room for sadness when we see a cheery smile— It always has the same good luck— it's never out of style— It naves us on to try again, when failure makes us blue; The dimples of encouragement are good for me and you. It pays a higher interest, for it is merely lent— It's worth a million dollars and it doesn't cost a cent.

A smile comes very easy—you can wrinkle up with cheer A hundred times before you can squeeze out a soggy tear. It ripples out, moreover, to the heart-string that will tug, And always leaves an echo that is very like a hug. So, smile away. Folks understand what by a smile is meant, It's worth a million dollars and it doesn't cost a cent.

—Baltimore American.

A CHEERFUL LIAR.

Judson Castor, gentleman of leisure, a member of many clubs, in order to escape the heat of the city went to the seashore. On the beach the morning after his arrival he noticed a lady whose appearance he admired greatly. She was about twenty-five years old and tastefully dressed and had a strong face and an independent mein. Castor sat on the beach where he could look at her as well as the bathers and between her and them divided his attention. When the lady tired of them she put up a huge parasol, took up a book and began to read. At noon she arose and went to her hotel.

This was repeated daily. The lady was never seen by Mr. Castor with any one else. He saw her go in and come out of her hotel, but never in company. She did not appear on the piazza or on the beach during the afternoon nor in the drawing room in the evening. Castor was obliged to be content to see her for a couple of hours in the morning. Not finding any one to give him an introduction, he set about contriving to scrape an acquaintance. One morning he went to the city, and when he returned in the afternoon he had with him a handsome stickpin, a large pearl in a bird's claw. The next morning, he approached the lady, lifted his hat most deferentially and said:

"I beg your pardon. I found this pin in the sand yesterday at the place where you had been sitting. May I ask if it is yours?"

The lady looked at the pin, put her hand to her throat, appeared surprised and said:

"I had my pin with me yesterday and thought I had it now, but I see I haven't. I didn't know that I had lost it. Thank you very much."

Mr. Castor made a remark about the pleasure it gave him to restore her jewel, but since it did not appear from her manner that she desired the incident to form a basis for an acquaintance he bowed again and passed on. But he was astonished.

He had found no pin, and he was not aware that she had lost one, and yet she had taken the one he had given her and did not even give him permission to chat with her. What did it mean? She was certainly a lady. But would every lady have the strength of character to refuse a jewel to be obtained so easily?

Mr. Castor was much put out. He had no objection to buying a woman's favor, but when he bought he expected the goods to be delivered. He purposely passed the lady late in the morning while he was walking from the foam line up the incline of the beach. She did not notice him. He looked at her the next morning on the beach, but she gave him no recognition whatever. Castor, when cool, had good enough judgment, but when irritated it vanished. He made up his mind that the lady was waiting for more of the same kind.

The next day he went to the city again, and on the following morning the lady received through the mail a little box containing a solitaire diamond ring. With it was a bit of paper on which was written, "Also found on the beach."

The next morning Castor went to the shore solicitous as to the result of his daring experiment. The lady was not there, but later he saw her coming, followed by a man whom Castor judged to be a porter. As soon as she reached the beach she pointed to Castor, and the man approached. Handing Castor the box he had sent the lady, he said:

"I am told to say that you have made a mistake."

Castor, coloring took the box and shoved it in his pocket. The lady turned her back broadly on him.

What did it all mean? Was she playing him for a big stake? Probably not, for she left the beach at once and the next morning did not appear. She had gone from the place. Castor went back to the city discomfited.

The next winter, one evening, while Castor was in one of the orchestra chairs at a theater, on looking up at one of the boxes he saw the mysterious lady of the seashore. He did not catch her eye and, man of the world as he was, had not the assurance to look up again. During an intermission he felt a tap on his shoulder, and a gentleman he did not know asked him if he might see him for a moment without. Castor's heart sank. He expected to have to answer for an insult to a lady. The man did not stop, as expected, at the foyer, but passed through it, mounted a flight of stairs, passed down the gallery and entered a box. Castor, following, stood before the lady of the beach.

"I have sent for you," she said, "to return what I supposed belonged to me, but was mistaken. I owned a stickpin like the one you handed me, though smaller. I never knew till after I had left the beach of my mistake. I have also the curiosity to know what induced you to send me the ring?"

And right here is where the genius of mendacity comes in. Castor, without flinching, asked, "What ring?"

The lady, astonished explained that she had received a ring which

Smoke has no effect upon Malthoid Roofing

Sulphur fumes around smelting plants, eat up a metal roof in short order, and very few other materials can withstand the attack. Malthoid Roofing does the business. Engineers and owners of property in districts affected by these fumes will save money by looking carefully into the merits of Malthoid. Write for special booklet.

she had supposed came from him. He looked so pained that she offered a double apology, one for receiving the stickpin and the other for returning him the ring. He was invited to remain with the party in the box till the close of the performance. He had secured his introduction.

She had been at the seashore with her invalid mother, which accounted for her being on the beach at times

RECIPES.

Corn Custard.

A corn custard makes a good dish for lunch. To a quart of corn which has been put through the food chopper, add a cup of milk and the yolks of two eggs, beaten well, salt and pepper. Put into a baking dish with bits of butter on the top and bake until brown.

Rice and Fruit.

A rice and fruit dessert may be made with a cup of rice stewed till thick and smooth in two cups of milk. Add salt to taste, two tablespoons of sugar and one tablespoon gelatin dissolved in a little milk. Add any desired flavoring and pour into a mold to cool.

Peel some small pears, add sugar to taste and cool in a little water till the fruit is transparent. When cool turn the rice out of the mold and surround with the pears and juice. Other fruit may be used if preferred.

Indian Griddle Cake.

For Indian griddle cakes, put in a large bowl half a pint of yellow meal, a level teaspoon of salt and one tablespoon of sugar. Pour over this one pint of boiling water, and when thoroughly mixed, add one and one-half cups of cold milk. Let the mixture stand at one side until perfectly cold, then stir in one cup of flour in which one teaspoon of baking powder has been sifted, and last add two well beaten eggs. Indian cakes should be cooked slowly and thoroughly.

One-Egg Cake.

One cup sugar, one large spoon of butter. Mix the two, then add one beaten egg and mix again. Two cups of sifted flour in which two teaspoons of baking powder and one-half teaspoon salt have been added, two-thirds cup of milk. Flavor with vanilla and lemon or with raisins. put into a cool oven until it has risen, then increase the heat.

Mayonnaise Dressing.

Have everything as cold as possible, and in warm weather it is well to set the plate in which the dressing is made on a piece of ice.

Into a cold soup plate drop the yolk of egg, squeeze upon it one teaspoon of lemon juice and stir until well mixed. Add, drop by drop a cup of salad oil, beating constantly until the mixture becomes quite thick, and being careful not to reverse the motion, as the oil and egg may separate. Season with half teaspoon of salt, one saltspoon of mustard and a dash of cayenne pepper. Thin the dressing with one teaspoon of vinegar.

"Effie," said Margie, who was laboriously spelling words from the first reader, "how can I tell which is 'd' and which is a 'b'?" "Why," replied Effie, wisely, "the 'd' has its tummy on its back." — Harper's Weekly.

HOMELY HINTS.

Sausages should be served with apple sauce or baked tomatoes. Either makes them more easily digested.

To clean a wetland shawl, put it in a pillow slip with a quart of white cornmeal. Rub and shake the pillowslip so that the cornmeal will penetrate every thread of the shawl. If the shawl is very much soiled, two applications of the cornmeal will be necessary. When clean, shake well, and, if possible, hang in the wind.

Strong hot vinegar will remove paint from window glass.

Bright sunshine will remove scorch which has been made by using an overheated iron.

Did you know, too, that in bleaching unbleached muslins, if you would put about three teaspoonsful each of coal oil and common baking soda into five or six gallons of water and boil them vigorously before putting on the line you would be aided wonderfully in the process? This is also a great help in the washings each week as it makes the clothing much whiter.

To remove the odor of anything burning on your range cover the place with salt. This will also remove the odor of fish or onions from the vessel in which they have been cooked. Turn them down over some salt on a hot stove for a few minutes.

ANANIAS OUTDONE.

Senator Tillam of South Carolina tells of a little girl whose statements were always exaggerated until she became known in school and Sunday school as a "little liar." Her parents were dreadfully worried about her and made strenuous efforts to correct the bad habit. One afternoon her mother overheard an argument with her playmate, Willie Bangs, who seemed to finish the discussion by saying emphatically: I'm older than you, 'cause my birthday comes first, in May, and yours don't come until September."

"Oh, of course, your birthday comes first," sneeringly answered little Nellie; "but that is 'cause you came down first. I remember looking at the angels when they were making you."

"Come here, Nellie, come here instantly," cried her mother.

"It is breaking mother's heart to hear you tell such awful stories. Remember what happened to Ananias and Sapphira, don't you?"

"Oh, yes, mama, I know. They were struck dead for lying. I saw them carried into the corner drug store."—Pittsburg Dispatch.

TOO MANY PIN-FEATHERS.

A well-known club man of Boston was married during the early days of the past winter to a charming Wellesley girl, who, of her many accomplishments, is proudest of her cooking.

The husband returned late one afternoon to his home in Brooklyn to discover that his wife was "all tired out."

"You look dreadfully fatigued, little one," came from hubby, in a sympathetic tone.

"I am," was the reply. "You see, dear, I heard you say that you liked rabbit. So early this morning I went to the market to get you one. I meant to surprise you with a broiled rabbit for dinner, but I'm afraid you'll have to take something else. I've been hard at work on the rabbit all day, and I haven't got it more than half picked."—Lippincott's.

Eyes Cured

Without the Knife

Grateful Patrons Tell of Almost Miraculous Cures of Cataracts, Granulated Lids, Wild Hairs, Ulcers, Weak, Watery Eyes, and All Eye Diseases — Send Your Name and Address with Two-Stamp for Free Trial Bottle.

The cures being made by this magic lotion every day are truly remarkable. I have repeatedly restored to sight persons nearly blind for years.

Ulcers, wild hairs, granulated lids disappear almost instantly with the use of this magic remedy. Weak, watery eyes are cleared in a single night and quickly restored to perfect health. It has repeatedly cured where all other remedies and all doctors had failed. It is, indeed, a magic remedy and I am glad to give this free trial to any sufferer from sore eyes or any eye trouble.

Many have thrown away their glasses after using it a week. Preachers, teachers, doctors, lawyers, engineers, students, dress-makers and all who use their eyes under strain find with this Magic Lotion a safe, sure and quick relief. If you have sore eyes or any eye trouble write me today. I am in earnest in making my offer of a free trial bottle of this lotion. I am glad to furnish proof in many well-proven and authentic cases where it has cured cataract after the doctors said that only a dangerous and expensive operation would save the sight. If you have eye trouble of any kind you will make a serious mistake if you do not send for my great free offer of this Magic Eye Lotion. Address with full description of your trouble and two-cent stamp, H. T. Schlegel Co., 223 Home Bank Bldg., Peoria, Ill., and you will receive by return mail, prepaid, a trial bottle of this magic remedy that has restored many almost blind to sight.

The last car of green fruit for 1907 left Vacaville November 21.

WHITE PLYMOUTH ROCKS EXCLUSIVE-ly. The largest flock of prize winning birds in the West. At the late Los Angeles show, 1907, we won twenty-three out of a possible twenty-five prizes. We offer extra bargains in our this year's breeders. Will sell to suit purchaser. Eggs \$2.50 per 15; \$10 per 100. A. J. LITTLE, Monrovia, Cal.

SACRIFICE SALE—LAST YEAR'S BREED-ers, White and Brown Leghorns from best laying strains, in lots of five or more at \$1.00 each, worth double the price. Also 30 fine mammoth Pekin ducks at \$1.00 each. HEMET POULTRY YARDS, Hemet, Cal.

GET INTO THE CHICKEN BUSINESS. I have a job for you. Earns \$45 to \$50 per month; takes half your time. \$750 required. Write BOX 120, Lordsburg, Cal.

FOR SALE—IN A BUNCH—TWELVE White African guineas; June hatch, M. F. COVELL, R. D. No. 2, Escondido, Cal.

HOGS WANTED.

WANTED—THREE THOROUGHbred Poland China boars ready for service. What have you, and at what price? J. A. WALTON, Redlands, Cal.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for \$1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow Street, Los Angeles.

"SURE HATCH" TO THE FRONT.

Famous Incubator Breaks All Selling Records. Over 140,000 Sold.

The year 1907 has been one of wonderful success for the "Sure Hatch" Incubator Company.

The output of "Sure Hatch" Incubators and Brooders was far in excess of any previous year, and with its splendid new factory, the largest in the world, the sales for the coming year will, undoubtedly, be on a still grander scale.

"Sure Hatch" Incubators and Brooders are used all over the world and have established the highest reputation for results.

The "Sure Hatch" Incubator is built of finest California Redwood, equipped with the Hot Water Heating System made of indestructible Solid Copper, and its Heat Regulator is at the side instead of on top. Hence, it has a convenient Table Top.

The "Sure Hatch" Safety Lamp burns less oil than ordinary incubator lamps, and never smokes.

This machine hatches every fertile egg and is so simple and easy to operate that no experience is needed. Thousands of men and women everywhere are making money raising chickens with "Sure Hatch" Incubators and Brooders. The Company has just issued a valuable Free Book on Poultry Profits that everyone should read. You can get a copy by writing a postal to the Sure Hatch Incubator Company, Box 150, Fremont, Neb., or Dept. 150, Indianapolis, Indiana.

COMBINED.

Two of the largest houses of Los Angeles, handling irrigation and mining supplies have combined and will hereafter be under one management.

These concerns are the S. J. Smith Machinery Co., well-known to Cultivator readers, and the Levi Booth Co.

The new firm will be known as the Smith-Booth-Usher Co., and the main office will be at 214 South Los Angeles street, Los Angeles.

The officers of the new company are: S. J. Smith, president; Franklin Booth, vice-president; W. H. Booth, secretary; B. S. Beddison, assistant-secretary and H. P. Usher, treasurer.

All kinds of irrigation supplies, from a washer to the most complete of plants, is the capacity of the firm. No problem will be allowed to perplex the corps of engineers.

Pumps to work under all conditions, and engines of any capacity are constantly in stock.

Mining machinery, wood working machinery and marine engines will be handled in their departments. That may not interest Cultivator readers, but it may show that it is a big concern, ready to do business in the machinery line in a big way.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Dec. 4, 1907.

Cutter.

Butter market is very firm, though offerings of buyers are often under quotations by 2 cents. Buyers offered 65 cents yesterday in large quantities, but sellers, as a rule, hold to quotations, which are yet 67½. Eastern is quoted 5 cents higher.

Creamery extra per roll... 67½
Firsts... 65
Seconds... 60
Dairy... 45
Cooking... 45@47
Eastern... 65
"Butterine"... 15@22½

Cheese.

Calves per lb... 4½@5
Sheep ewes per head... 4.75
Lambs per head... 3.75@4.25
Wethers... 5.50

Potatoes.

The potato market is weak and very uncertain. A local paper says of it: Dealers are still in a quandary over what the final outcome of the potato deal will be this year. There are many who look for prices to go still lower than they are at present or than they have been at any time so far this season. They declare the supply in the northern country is yet unlimited and it is only a question of time until the money situation eases up when the large operators will jump into the northern field again and buy up those potatoes in a wholesale way and dump a large portion of the supply down upon the local market regardless of its condition.

Highlands... 1.15@1.25
Early Rose... 1.75@2.00

FERRY'S FREE SEED BOOK.

For half a century thousands and thousands of farmers and gardeners have regarded "Ferry's Seed Annual" as the best guide not only for the buying of seeds, but for their planting and care. Daily reference to its text and illustrations proves it to be the actual beginning of a successful season. The new edition for 1908 is now ready for free mailing to all who write to the publishers for a copy.

It is a high tribute to the house of D. M. Ferry & Co. that two generations have planted Ferry's Seeds, each succeeding year adding to the confidence that "seed trouble" will never arise when Ferry's seeds are planted as "Ferry's Seed Annual" says they should be.

Another remarkable feature developed by the house of Ferry is the method of distributing seeds to dealers throughout the country so that the planters everywhere can secure a their home store exactly what they want when they want it, with the absolute assurance that it is fresh and fertile. Everyone should send at once to D. M. Ferry & Co., Detroit, Mich. for the 1908 edition of "Ferry's Seed Annual."

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

San Francisco Markets

SAN FRANCISCO, Dec. 3, 1907.

Butter.

Butter has advanced a couple of cents for extras during the week, though the market is rather dull at this time.

The current prices on dairy products in San Francisco are always from 2 to 3 cents higher than the rates given in the daily official list of the Wholesale Dairy Produce Exchange. The retail dealers in this city invariably pay an additional 2 cents per pound on butter and per dozen of eggs, and occasionally it is 3 cents. On cheese the increase is 1 cent per pound. By making these additions to the Dairy Exchange prices the producer in the country can always determine the actual prices ruling in this city. The quotations as prepared by the San Francisco Wholesale Dairy Exchange yesterday were as follows:

California extras per lb.35
California firsts.34
California seconds25
Eastern extras.24 1/2
Storage Cal ex.27 1/2

Cheese.

California young American fy16
California flats fy.14 1/2
Eastern fy.18 1/2
Oregon fancy.15 1/2

Eggs and Poultry.

Eggs have declined four cents for extras and firsts, and lower goods show a still heavier decline. Storage holds its own.

Poultry is going begging and most dealers are holding over rather than accept present low offerings. On top of the Thanksgiving hold-over two cars of Eastern came in yesterday. The top asking price on turkeys is now 20 cents. Other asking quotations are much the same as last week.

Citrus Market

LOS ANGELES, Dec. 4, 1907.

Oranges are going forward at a more liberal rate than for several years at this date. The market is not strong and some fruit has sold rather low. In fact, it may be said that quotations over the East at this time is practically a dollar lower than they were a year ago at this time.

Lemons are also in the dumps and bringing a very low price.

Shipments.

Shipments of citrus fruits to date, are 906 cars, of which 380 were lemons. Last year same date 301 cars, of which 211 were lemons.

NEW YORK, Dec. 2.—Six carloads of navels and two carloads of lemons were sold. There is a fair demand for good colored navels, sizes 80s to 150s. The lemon market is weak and lower. The weather is clear and cold.

Queries and Replies

Continued from Page 555

at hand it is most convenient to dissolve just the amount required for a tank in each.

The lime should be slaked in a small amount of water and then strained into the spray tank along with one-half to two-thirds of the water required for the tank. Now add the bluestone solution, stirring constantly. If a power outfit, start the agitator. When the mixture is complete add what water may be required to fill the tank.

Spray at once for blight; if for curl leaf, not until spring.

Chlorosis.

I am sending some orange leaves which are turning yellow, some more than others, not only one tree but quite a number and are over the whole orchard. Here and there the whole tree, others part of the tree.

The soil is sedimentary loam some two and one-half feet deep then sand and gravel.—O. P., Corning.

The orange leaves you send are affected with chlorosis, but just what is the cause, we cannot say at this time. Dr. R. H. Loughridge at the Agricultural Department at Berkeley is now working on the problem. I has issued a circular on the subject. This you can get from the Director upon application.—J. W. M.

Raising Price After Signing Lease.

I am informed that it is now legally possible for the owner of a property to raise the rent on a leased property arbitrarily, in spite of a rental stipulated in the lease, and leave the renter no alternative but to pay the amount or surrender the lease. Is this true?

In sowing vetch in an orchard, is it advisable to leave spaces along the tree, rows for cultivating or may the vetch completely cover the ground?—R. J. T., Gardena.

We know of no such law. If your lease is in writing the terms therein must govern during the life of the same.—L. M. F.

The sowing of vetch in spaces makes easier plowing under. If sowed all over the ground, early plowing is necessary at first that the second, cross plowing will not tear out the green matter before it is partially decayed.

Apricot Seedlings.

I have a lot of apricot seedlings to graft; what can be grafted on them? Can apricots be grafted or merely budded? If anyone of your readers knows, please mention the different kinds of fruit which I can graft on them.—I. V., Livermore.

The apricot root is objectionable as a foundation for the peach, as it never forms a perfect union. It does well for an apricot top which is best for it.

Taxes on Mortgage.

Please tell me through your columns whether the giver or the holder of mortgage could pay the taxes on real estate.—A Subscriber.

The holder of the mortgage is required to pay the taxes, unless it has been agreed that the mortgagor is to do so, in which case the full amount of the tax should be assessed against the land. It is usual for the mortgagor to charge a higher rate of interest when he is to pay the tax, as the mortgage and the land cannot both be taxed.—L. M. F.

FERN PARK POULTRY RANCH.

The advertisement of the Fern Park poultry ranch is new to many readers, yet it is a well established ranch. There are bred on this ranch Buff Orpingtons and Indiana Runner ducks. The ranch comprises three and three-fourths acres at Corona. There are used three 450-egg incubators for hatching. The brooder house is 100 feet long with a 60-foot annex. One feature we liked about the houses is the concrete floors in the incubator house and brooder. Those desiring stock or eggs should write this ranch, as the owners are reliable and personally look after their orders.

TALLERDAY SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only way to irrigate alfalfa. Cheaper than Flumes. This is only one of our specialties. We make Riveted Water Pipe in lengths of ten feet from single sheets. Let us prove to you that we make Pipe and Tanks right. WRITE FOR CATALOGUE.

Los Angeles, Cal.

DON'T BUY GASOLINE ENGINES

UNTIL YOU INVESTIGATE "THE MASTER WORKMAN," a two-cylinder gasoline, kerosene or alcohol engine, superior to any one cylinder engine; revolutionizing power. Its weight and bulk are half that of single cylinder engines, with greater durability. Costs Less to Buy—Less to Run. Quickly, easily started. Vibration practically overcome. Cheaply mounted on any wagon. It is a combination portable, stationary or traction engine. SEND FOR CATALOGUE. THE TEMPLE PUMP CO., Mfrs., Meagher and 15th Sts., Chicago. THIS IS OUR FIFTY-FIFTH YEAR.

The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine straight ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gauge depth to which moldboard should cut. It's a very desirable machine for road-building in city or village. It makes good roads and keeps them so. Although made of steel and malleable iron, still it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveeing, Foundation-digging.

For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet, "Delightful Roads." It's free and tells you all about the 20th Century.

California Cultivator

Los Angeles December 12, 1907 San Francisco

THIS is a view of a class at California Polytechnic School constructing a poultry plant. The construction of poultry plants is a leading feature of the course at this school. In the illustration the class in poultry culture is seen laying out runs, building and hanging gates, etc.

About half of the student's time is devoted to theory in the class room, a number of lectures are also given on the history of the breeds in order that the student may become familiar with the different crosses that were used to produce our standard bred poultry. Another line of work taken up in the class room is a study of feeds and feeding and the balancing of rations. Lectures are also given on mating, breeding and judging, attention being given to the judging of birds for utility purposes rather than fancy points. Drafting is also a part of the student's classroom work; drawings are made of different types of poultry houses and appliances, also the laying out of poultry plants.

THIS scene represents Mr. Lunn delivering a lecture on artificial brooding. These lectures are based on actual experience in brooding chicks in the brooders at the school farm. They give not only the scientific, but the practical side of the work.

Too much cannot be said of the good the school is doing. We have in our own State and throughout the United States, agricultural colleges, where men are prepared for teaching and for higher work, but here at the Polytechnic School you will find the boys who are to go back to the farm and do the actual work, the boys who are to be the future farmers of our State. The young man who would probably have left school after finishing the grammar grades now has a chance to continue his study and to do things with his hands, things which are not only interesting to him now, but will be of great service to him in after years.

THE illustration shows part of the poultry plant at California Polytechnic School, San Luis Obispo, California. To the left is the house used at the present time for an incubator room, feed room and office. To the rear is the brooder house which is divided into six pens for the use of individual brooders, and is also used as a laying house during the laying season. At the right will be seen a few of the different types of colony houses used at the school.

This is the only school in the State teaching a complete course in poultry culture. The work is under the direction of Mr. Alfred W. Lunn, who is well fitted for the position. He has spent several months recently in traveling over the State visiting the best poultry ranches, and gathering data for this week.

This is a secondary school of agriculture, mechanics and household arts. Students are admitted after completing their work in the grammar grades, or upon examination, which is given upon subjects covered by the grammar school.

Coulson's Improved Mash Egg Food

Takes
Less
Feed

Makes
More
Eggs

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of COULSON'S NO. 3 CONDITION POWDER will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time they must have the best food you can give them from the commencement of the molt. You will find COULSON'S IMPROVED MASH EGG FOOD is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-Pound Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

COULSON'S IMPROVED MASH EGG FOOD is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Poultry Possibilities in California

An Industry Yet in Its Infancy and With a Great Future. Let It Be Encouraged and Vast Importations of Poultry Products Stopped.

BY FRANK H. THOMAS, LOS ANGELES.

ODE TO THE HEN.

Kind mothers of broilers,
I sing to thy praise;
Though thy voice is strident,
I admire thy lays:
Thou art early to bed,
And early to rise,
And yet art neither
Witty nor wise.

IF WE were able to take an air ship and rise above this continent, and from there study this hurrying, jostling crowd of humanity, we could see at a glance that the problem of living is becoming more and more complicated each day. That the proposition "back to the land" is becoming more popular day by day.

Rural home seeking and rural home making is occupying a place in the minds of many Americans who were never interested before. On every hand, and particularly here in California, we hear the one desire expressed on all sides that we may own a small ranch where we can raise poultry and fruit and live independently.

The Cultivator feels it its duty to help just this kind of people, and with that in view devotes much of this issue to poultry. We have given many illustrations of fine fowls that were bred and raised here in California. Many of us know that the poultry industry of this State is one of the important ones, and is being developed fast, yet it is not half developed.

The Cultivator stands for pure bred poultry, bred for fancy and utility, and to that end is always ready and willing to encourage, promote and foster the industry in every way possible.

California offers a better market for commercial poultry than any State in the Union, and is today doing more to develop the industry than any of her sister States. She has some of the largest poultry ranches; yes, a whole city and community devoted almost entirely to breeding White Leghorns. We refer to Petaluma, which boasts of her 1,500,000 White Leghorns.

Petaluma has San Francisco for a market for her eggs and poultry. Her producers have organized an association for marketing their produce, and in this way assure the public that they are always getting fresh eggs, and in turn they secure the highest possible price for their produce.

Our friend Miller Purvis, editor of Poultry, after spending almost a year in this State studying the conditions of the industry, says:

"Few people in the East comprehend the size of California and the important place it is destined to take in the poultry industry. It is safe to say that no State is making more rapid progress as a poultry State than California, and it is entirely probable that the next census will show that it leads all other States in the breeding of poultry. With the mountains to the east full of miners, always hungry for poultry and eggs and Alaska, constantly growing in population without any possibility that it will ever produce poultry enough to be well worth mentioning, there is, indeed, an illimitable outlook in the great Central valleys of the San Joaquin and Sacramento rivers and the southern portion of the State lying south of the Tehachepi mountains. Here is an area larger than most of the great States of the Middle West, perfectly adapted to poultry breeding and surrounded by a hungry multitude which has no present or prospective facilities for producing poultry and eggs. This can not fail to stimulate the poultry business to a great degree. Besides California will always be the resort of tourists, health-seekers and the luxury-loving rich, who will seek its genial winter climate to escape the rigors of the winters of the East. All these have money to spend and have the habit of living well. The poultry breeder may depend on a large demand from these sources and look forward to being called upon for a constantly increasing number of eggs and pounds of poultry. In all our broad land there is not a more promising outlook for the poultry industry than in the State of California, and the fanciers of that State are beginning to understand this fact and prepare for the demand that will be made on them by breeding the best and highest quality of poultry, such as their market demands and is willing to pay for."

While Northern California produces by far more poultry than Southern, yet there is no reason for this for it has the climate, soil and market that is equal to any for the production of both commercial and fancy stock. We have a market that will get better each year, so those who expect to engage in the business need have no fear of the supply being greater than the demand.

That the fanciers are doing their best in developing this industry, is evinced by the fact that San Francisco on the north and Los Angeles on the south hold each year shows that rank well with the largest of the Eastern shows, New York and Boston only outranking us. Besides these shows there are a number of smaller shows held each year in the State.

The quality of birds shown at California shows compare favorably with the best birds in the country. Our fanciers have been liberal, yes, almost extravagant with their money when birds were wanted for breeding, the result being that now we have as good birds as can be found in the country. And we predict a bright future for the fancier, for the time will come when California birds will be sought just as California fruit is today. For here we can and do hatch chicks every day in the year, and with our mild climate and perpetual supply of green food, we can send our brother fancier "back East" birds that are as near perfection as ever stood before a judge.

Perhaps the old saying,
Was meant just for men,
And did not include
The motherly hen;
Though it does all the work,
The crowing is done
By the males of the household,
As usual, By Gum!
P. S. In other words, "Everybody Works
but Father."

Mission View Poultry Ranch

An Interesting Article Describing a Visit to the Ranch Where White Wyandottes Are Bred on a Large Scale. Where Over a Thousand Wyandottes Are Successfully Bred

Photos and Description by Frank H. Thomas.

More than a century ago the old padres marching northward through California and establishing a chain of missions chanced into a beautiful valley north of Los Angeles a few miles, and as usual they proceeded to honor one of their good saints by giving it his name. The next step was, of course, the establishing of a mission, and old San Fernando Mission became the gathering place of many of surrounding Indians, and of the Spaniard and Mexican, who had occasion to travel El Camino Real.

The riches of the surrounding lands soon proved the wisdom of these fathers and the vine, the olive and the orange were soon growing in profusion. The American, after the occupation, to a certain extent neglected the opportunities offered by that vicinity and for years it was not developed as its natural advantages would have warranted. Today, however, there is much development, and many are taking advantage of the section to establish fine paying properties there. Amongst these are Mr. and Mrs. C. D. Hubbard, who have established the Mission View Poultry Ranch, one of the largest and best known poultry ranches in Southern California.

Lemons and Poultry.

Here on a beautiful November day, found Mrs. Hubbard busy with her poultry and Mr. Hubbard picking lemons. The greater part of the ten acres is set to lemons which are in full bearing.

About eight years ago when Mrs. Hubbard embarked in the poultry business she had her ranch fitted up for commercial poultry. She intended to raise broilers, thinking there was no money in fancy poultry. With this idea in view she had her plant constructed on a large scale, building an adobe incubator holding 3000 eggs.

First of Its Kind.

This incubator when built was the largest in this country and the first of its kind to be built. It is one of the interesting things of the ranch. To heat this monster, gasoline is used to heat a large adobe oven which furnishes hot air to heat the incubator proper. The incubator is provided with a nursery, and is easy to regulate in regard to heat and moisture; the hatches have been very satisfactory.

'Dobe Brooder.

Besides this adobe incubator there is also on the ranch a hot and cold adobe brooder built on the continuous plan, which has a total length of 360 feet. Part of this is used for a cold brooder or where the chicks are put after they are large enough not to require artificial heat.

The warm part of this brooder is heated with hot water pipes running from a large stationary boiler, which is heated by a distillate burner and provided with the best of ventilating systems. Each section of this brooder is provided with an indoor and outdoor run.

Chose the 'Dottes.

After the ranch had been fitted for broilers, Mrs. Hubbard being attracted to the Wyandottes she decided to give this bird a trial. At that time she had several varieties of fowls, but after finding the Wyandottes so profitable, she gradually discarded one variety after another until now she only has the White Wyandottes of which she keeps two separate and distinct strains; the Washington and Lafayette strains.

Two Hundred or Better.

These strains are bred not only for fancy, but utility as well, as Mrs. Hubbard pointed out bird after bird that had an egg record of 200 eggs or better; no bird is kept which has a record under 144 per year.

In each breeding yard trap nests are used and an accurate record of each hen is kept, and unless a hen proves a good layer, although she may be bred in the purple, she must go to the block. In this way she has a strain of Wyandottes that lay as well as any of the Meriterraneans. Another thing that is very noticable is the large eggs this strain of birds lays. Along this line Mrs. Hubbard has made especial effort in breeding and her success is shown by the magnificent size of the eggs. Color is also a fancy of Mrs. Hubbards, and her birds are now producing with fair uniformity a shell with a pinkish tinge. She expects in time to fix this trait of color of shell.

In the Four Hundred Class.

When I was at the ranch Mrs. Hubbard had about 1000 birds and I never saw a better large flock of birds. It is no unusual thing to go into one's yards and find a few good birds, but to go to a ranch and find over 400 breeders mated up and not a bad bird in the lot, is certainly a sight to behold.

Besides the "400" Mrs. Hubbard has over 600 very promising youngsters. She expects these to be ready for the breeding pen next spring. One thing I attribute the success of this ranch to is the thorough knowledge of the true Wyandotte type.

I so often visit ranches where thoroughbred poultry is bred and find those in charge of the mating and breeding entirely unable to settle in their minds the true type of the bird they have chosen to breed. But Mrs. Hubbard has the correct type in her mind and is able to mate to produce it.

Lafayette and Mate.

Hen—490.

Hen—Snowball.

Hen—Queen Sylvie.

Cockerel—400.

in writing advertisers, mention Cultivator

Artificial Incubation

BY FRANK J. IRONMONGER, LOS ANGELES.
Written especially for the Cultivator

The writer of this article is an old time poultryman with an experience of over ten years. For the past five years he has made a close study of artificial incubation, having had charge of the incubator department of the Henry Albers Co., of Los Angeles.—Ed.

THIS subject has been discussed by all the poultry journals in the world and, I am afraid, has been discussed with the "dis" off by many poultry breeders, which should not be for nine cases out of ten, it is the fault of the operator rather than that of the machine.

I will frankly admit that there is a great deal left undone that will go to make the perfect hatching machine, still a great many of the incubators now on the market do wonderful work compared with the machines of twenty years ago, or even less than that. When purchasing an incubator, first purchase it from an honest business house, which will assist you in having success. Do not go to those who merely want your dollar and then turn you loose, but one who is willing to make each machine he sells a good standing advertisement for himself. Second, see that you understand all the workings of the machine before you leave the sales room, and don't take it for granted you can learn how to operate the machine in a moment, by reading the directions, when you get home.

It will help you a great deal by having the different parts explained. Third, notice particularly the condition the wood is in; it should be well seasoned and the seams closely joined and accurately put together; the changes from moist to dry are frequent, and unless the wood is in prime condition the machine will not last long. Fourth, and the one I think most important, is the ventilation. There are several different methods of ventilation, adopted by incubator manufacturers, and many of them are good, while others have practically no provision for pure air going into the egg chamber or for foul air going out. Unless an incubator is well equipped with ample ventilating devices it is almost worthless, especially after the first hatch. When the machine once gets moist and impure it is a difficult matter to dry it out.

The temperature in most all incubators on the market is easily and accurately controlled by the use of simple regulating devices, so that the operator need have little anxiety for uniform heat. I think there is too much stress laid upon uniform temperature throughout the entire hatch, and a great many operators are more or less led astray by it, thinking that they must not let the heat run above 103 degrees, or lower than 103 degrees; but the mercury must remain at that spot all the time or the hatch is ruined. If the temperature ever changes from 103 degrees and the hatch is poor, they know why it was a failure. More likely it was because the eggs were kept in a too constant heat. Avoid overheating eggs at any time during the hatch. It causes the heart to pulsate rapidly, the greater the heat the more rapidly it pulsates, until unable to keep up under the strain, a blood vessel bursts and a dead embryo is the result.

Underheat, if not too frequent, will do no harm even if the eggs get cold. Many readers, no doubt, have had experience with a hen leaving her nest just a few days before hatching

time or sooner, and to the hands the eggs are stone cold, possibly been left uncovered all night. You were on the verge of throwing them away, when you thought you would try them under another hen and to your surprise at hatching time the nest is full of strong, healthy chicks. Give these same eggs at the very same time as much additional heat over 103 degrees as they had cold below 103 degrees and you would have nothing but cooked eggs. Bear this in mind for the same rule holds good with an incubator.

When you have your tray of eggs outside the machine turning them, leave the machine door open and let the egg chamber cool down and also change the impure air to fresh air. I hear someone say: "My directions say close the door." I know they do, the incubator manufacturer wants to save fuel for you; but just try it once and see if your results are not better. If there is no air stirring in the room and the machine is large, take a fan and force a change of air in the machine.

Turning the eggs during incubation is a necessary feature to insure a successful hatch. The turning not only prevents the embryo from anchoring or settling to one side of the shell, but the exercise brought on by struggling and turning gives the embryo strength that insures a strong, healthy chick.

The hen is a perpetual turning machine, using her beak or her legs and wings to roll the eggs and shift their position. She doesn't care whether the eggs are turned exactly over or not, but simply keeps them moving. Incubator operators: It is just as unnecessary for you to mark your eggs and see that they are turned exactly over as it is for the hen; just simply shift their position, or in other words, stir them up, being careful that the large end of the egg is not left turned downward.

It is amusing to hear how different people prove that incubators are a failure and absolutely unreliable; they give as their authority something like the following: "I set a hen and an incubator, just to test them, about four weeks ago at the same time and on eggs from the same pen. Under the hen I put 13 eggs and from these she hatched 10 strong, healthy chicks. I placed 260 eggs in the incubator and it hatched only 190 chicks and six of those were cripples. Now, what do you think of that?"

Well, I think it is about time to ask a few questions, so I go to it. I find that the pen of fowls contains 25 females and two males, all feeds and conditions excellent. About 15 hens are laying which is just enough to set the hen with fresh day-old eggs; on the other hand the incubator must wait at least 18 or 20 days to get its supply. The eggs for the hen are carefully selected, discarding all eggs that are not the proper size; the incubator having waited so long, must take all of them no matter about size or shape. They have carefully collected the eggs for the incubator, but had never thought of turning them, which alone would

Success Plow

A
Frameless Plow
That Will
Last a Lifetime

The Best and Cheapest Plow is the Success.
Why?

Because it does the same work as plows that cost a great deal more.

It costs less than higher priced plows because it is made of fewer parts.

On account of its having fewer parts it won't get out of order.

Plows get out of order because they are complicated. The Success isn't complicated—it's very simple.

A plow that won't get out of order is what you want, isn't it? You would call such a plow strong and durable.

That's why the Success Plow is named "SUCCESS."

Being less expensive than others, doing first-class work, possessing the essential qualities of strength and durability, the Success deserves all we claim for it. No use to ask now why it is the cheapest.

The best is always the cheapest.

Equipped with the best bottoms made; adjustable front axle; dust-proof removable wheel boxes; adjustable rear wheel; easily set for any depth; works equally well with large or small horses; has light draft and is easily operated—a perfect plow.

Dead in the Shell

BY M. A. SCHOFIELD, GARDENA.

Written especially for the California Cultivator

Mr. Schofield is connected with the Gardena Hatchery, which uses the Bih Schofield method of incubation. This concern had an output last year of 200,000 chicks, and has increased its monthly capacity from 3500 to 100,000 in the past few years, or a present capacity for the year of 500,000 chicks. Mr. Schofield's experience qualifies him to write intelligently, and we believe his article will be of great value to Cultivator readers.—Ed.

WE wish to say in the beginning of our discussion that we do not regard the chicks found dead at the time of exclusion, as perishing from any specific malady or poisoned by any germ or microbe found only in unhatched eggs. We have seen this theory championed by some learned writers, but our observations lead us to believe that the bacteria present are not the agent or cause of our disaster, but are rather something which results from our mismanagement.

Causes.

As to causes, we have three principal ones, viz.: Unfavorable temperature, improper ventilation and low vitality of the eggs. First and foremost of these is the question of temperature. Anyone who has hatched many chicks, either with hens or by artificial means, finds some small percentage of defective chicks. It is evident from malformation of toes, neck, beak, or knee joint, that at some critical time in the development of these different parts, some circumstance intervened which caused an abnormal articulation, or joining of the different members making up the whole. We might say, in passing, that the great cause for such defects of frame is low temperature for that particular egg sometime during the first ten days. There are other causes, but this is chief. All the defects above mentioned do not constitute, necessarily, a fatal defect, however abnormal they may be. These then are the mildest forms of faulty development. When we break open the eggs which failed to hatch we find monstrosities of all degrees. Defects which would make it impossible for the chick to live even if it could free itself from the shell.

To sum up, we believe there is no part of the chick structure which is sometimes abnormal, but it is only the least extreme which are ever seen in the living chick. All the others more marked cause the death of the embryo, and the result is chicks dead in the shell.

High Temperature.

When the temperature reaches about 100 degrees, the action of the embryonic heart begins to approach normal rate of pulsation. Below that it beats slower as the temperature falls, while at 105 or 106 degrees the speed of its movement is something marvelous. Rate of pulsation is anywhere between 80 and 160 beats per minute, depending on extremes of temperature and stage of development. Now, if the temperature is kept constantly at 103 or higher, giving no time for rest, then the pace is too swift for some of the embryos and some more chicks are found dead in the shell. High temperature brings in a new train of malformation chicks which throw themselves on their backs, some with enlarged liver or having protruding entrails or unsorbed yolk sack. Here again it is only the least abnormal which hatch; the others die earlier. What is known as "sticky" chicks are usually the result of improper temperature together with bad ventilation.

Ventilation.

The next great cause is lack of ventilation. We wish to say that, with any standard incubator, run above ground, it is only when lack of oxygen is coupled with high or low temperature that we find the greatest destruction of chick life, either before having hatched or afterwards. Many a hatch would have been fairly good with but one of these unfavorable circumstances, but is now a total failure when both temperature and ventilation were at fault. Different incubators ventilated differently, and often we must aid the machine by airing the eggs for a short time several times a day. I have heard of some who fanned the air out of the machine; in other placed an air pump on top of the incubator and drew off the gas from the egg chamber. Work it as you will, an egg needs fresh air and must have it if strong chicks are to hatch. All defects in ventilation leave a deadly trail from the incubator to the brooder, when the final results are found. Some good hatches, as far as number is concerned, are handicapped by impurities from the incubator that no one can make them live.

Low Vitality.

The third cause, low vitality, results from debilitated parent stock, lack of balanced ration for the layers, or stimulating the hens with condiments. Eggs kept in a draught or kept too long are other causes.

We have tried to give the philosophy of chicks dying in the shell. There is no royal road to knowledge nor an easy one in any way, but I hoped that this article will help some in the study of the topic. We have spoken only in general terms and the bad effects of high and low temperature, poor ventilation and low vitality seems to overlap each other in the appearance of deformed chicks.

Chamberlain's Perfect Chick Feed

World's Chick Feed of To-Day. The only original Dry Chick Feed. All others are worthless imitations. Chamberlain's Perfect Chick Feed was used exclusively at the great St. Louis World's Fair during the 7 months. This is the highest compliment paid to any manufacturer of poultry food in the world. Perfect Chick Feed also endorsed by the U. S. Experimental Station and the Columbia School of Poultry Culture. All the leading poultry men of the country use Chamberlain's Perfect Chick Feed on its merits.

The Farmer's Fowl

BY DR. C. E. WINSLOW, MONROVIA.
Written especially for the California Cultivator

In breeding Rhode Island Reds, Dr. Winslow has made a careful study of the utility and practical qualities as well as the fancy. He finds in them a bird for the farmer and the marketman as well as for the fancier.—Ed.

THE RHODE ISLAND RED is an American product to meet American requirements. It was originated by the farmer to satisfy the demand of the farmer for a fowl of a, with a good quality of flesh and better laying habit than the usual of fowls possessed.

New Englander.

For over fifty years the thrifty New England farmers along the coast of Rhode Island and Massachusetts are developing this great breed of fowls, by selecting the most persistent layers, especially those that supplied the market when prices were best. They selected them to strong, vigorous males, mostly the great Malay game cocks brought them by the sea captains from the Malay peninsula. There were numerous Cochin and Chittagong crosses and some introduction of pure Leghorn blood. This combination of the laying female and the strong game blood year after year brought a steady improvement in the breed until the Rhode Island Red became the greatest of winter egg-producers, as well as a superior table fowl, with an appetizing flavor to its flesh that surpassed by no other breed.

This American product asserts its claim of being the popular utility fowl of America. It has spread out from its New England home and is finding its way into the farm-yards of every part of the country. Whenever the Rhode Island Red has obtained a fast hold it has retained it in the face of opposition. In yards where it has come in competition with other breeds, competition has almost invariably given away to this progressive bird.

Practical Bird.

This coming fowl is a practical bird that brings in the dollars, no other fowl surpassing the Red in giving returns for so little care.

The Rhode Island Red is a good, not gross eater. As a rule it does not run to fat, although like a good layer, the more the Red hen eats the greater the returns.

This great utility bird is hardy, progressive and contented, and easy to raise. The pullet matures early, laying at five or six months, and once started at egg-making keeps it up summer and winter.

The hen lays as well at two years as when a pullet, is easily broken from laying and will usually begin laying again in a week, makes a good mother and in most cases furnishes eggs before her chicks are weaned.

Good for the Table.

The Red does not fat up behind as most of the larger breeds and is as clean-cut and trim at three and four years old as a pullet. The yellow skin and yellow leg, the color preferred by the housewife; long, plump body, containing an excess of white meat, and fine grained, closed textured flesh, colored by the game blood, makes the Rhode Island Red the ideal table fowl. The wonderful, growing popularity of the Red is proof of its valuable qualities, and that the Rhode Island Red is destined to become the leading fowl for the utility man as well as the fancier is a foregone conclusion.

Good Blood.

To give any breed a fair test the

best of blood must be chosen, for the poorest of the best may not be as good as the best of another breed. Cheap stock will most often give cheap results. This applies to chickens as well as to cattle and hogs.

To make a success with any breed

of fowl it must be given a fair chance. The surroundings must be congenial and the houses supplied with pure air, free from drafts and vermin.

Under these conditions the Rhode Island Red will thrive and prove the

greatest utility fowl of all breeds, by supplying an abundance of good sized brown eggs, summer and winter, and furnishing a table fowl whose richness and flavor of flesh cannot be excelled by any other breed.

MALES AND FEMALES OF DUCKS AND GEESE.

While there is a strong resemblance between the gander and goose, there are certain characteristics which are well defined. The head of the goose is smaller and narrower than that of the male, while

The same rules hold good with drakes and ducks of all varieties, and it is well to familiarize oneself with the cry of the two sexes, for in birds whose feathers are alike in male and female it is easy to overlook the other points of difference, but the cry of each sex is so dissimilar as to make an infallible distinguishing sign.—Rural World.

SOME USES FOR EGGS.

To clean vinegar bottles and cruets, crushed egg shells in a little water are as good as shot, besides being healthier and handier.

An egg well beaten and added to a tumbler of milk well sweetened, and

Some of Winslow's Rhode Island Reds.

the latter has a thicker neck and general masculine appearance. Perhaps the most noticeable difference is in the voice, that of the female being coarser and harsher than that of her mate.

two tablespoonfuls of best wine, is excellent for feeble, aged persons who can take little nourishment.

For boils take the skin of a boiled egg, moisten it and apply. It will draw off the matter and relieve the soreness in a few hours.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Flicher, Commissioner.

And Now Comes New Reward for Merit

Selecting and Mating the Breeding Pen

BY FRANK E. BALDWIN, OF SAN JOSE.
Written especially for the Cultivator

Mr. Baldwin's winnings in the show room have proven that he has made close study of mating and breeding White Leghorns. His birds are considered competent judges as being the true Leghorns.—Ed.

THE FIRST thing necessary in selecting and mating a breeding pen is to have a fair understanding of what we desire to produce.

Naturally we want to produce the best possible birds for the desired purposes. Why should we breed any particular variety of standard-bred fowls? Why not cross different varieties and get something better?

The answer is that crossing has been tried over and over again by amateur and professional breeders with varying success. Usually with results less favorable than the standard-bred fowls of today will yield in profit or pleasure. The standard-bred poultry of today is made up of the varieties which have stood the test of time. It is the survival of the fittest. We cannot afford to spend time or money with anything else.

The American Poultry Association, at great expense, has given us the American Standard of Perfection. To this book we must go to get our conception of what we want to produce before attempting to select the birds to compose our breeding pen.

By a close study of the Standard's requirements we can fix in the mind the type of bird we desire. The great law of inheritance is summed up in the simpler words—"like begets like." Qualities, good, bad and indifferent are transmitted alike.

From observation, it is laid down in the books as a fact that—"a descendant inherits one-fourth of the total of his qualities from each of his parents, one-sixteenth from each grand parent, one-sixty-fourth from each great grand parent and one-two-hundred and fifty-sixth from each great-great-grand-parent."

It follows that the number of inheritable qualities is very great. The offspring may inherit a portion of its qualities from each and every one of thirty ancestors.

These qualities, so inherited, may be of divergencies from the Standard in numberless ways. Hence, the need of starting with the best specimens obtainable.

Half The Pen.

The male bird is one-half the pen; the importance of having a good male to head the pen cannot be over-estimated. Some one to emphasize this point has said. "First get a good male, buy him, borrow him or steal him, but get him."

Next, have the pen composed of all the best females possible. While the male bird is one-half the pen, he is only half, the other half of our breeding pen must be made up of numerous females, each and every one selected for its individual merit.

From the way the offspring "breed back" to the undesirable as well as the desirable qualities of their ancestors it follows that the safest birds to put into our breeding pen must be those which have been carefully bred for a long time and from whose blood many undesirable qualities have been "bred out."

These are the only birds that can be relied upon to "breed true" to standard requirements—i.e. transmit a preponderance of desirable qualities.

In selecting and mating a breeding

pen we must decide, also, how many to put in the pen. This depends somewhat on the male and whether his intentions are well distributed, but, as a general rule for Asiatics 6 to 10, Americans 8 to 12 and for Mediterranean 10 to 15 will do.

Best Ages.

The age of the birds must also be considered. The best age is from months old for both male and female. At this age you know whether or not your birds are holding their good qualities. If they do you have safe breeders. If they do not hold the best qualities observed in them when cockerels and pullets they are not reliable breeders.

The next best plan to mate is to mate cock birds with pullets and cockerels with hens. In this mating, the large mature cockerels should be used with the adult hens and only large, fully matured pullets with cock birds. In some of the early maturing varieties, take the leghorn fairly good results come from mating fully matured cockerels with fully matured pullets.

Hens three and sometimes four years old, if particularly fine specimens, can be used in a breeding pen at which head is a vigorous cockerel.

Sometimes a cock bird 3 years old of a good specimen and in good condition can be successfully used in a small pen of fully matured pullets.

For Meat and Eggs.

In fowls kept for meat or eggs consideration must be given in selections for our breeding pen to performance of the birds themselves or their ancestors. In mating for meat production, select the rapid growers with strong constitutions.

In mating for egg production breed from those with strong constitutions whose ancestors and progeny are prolific egg-producers.

It is not necessary to breed from phenomenal egg-producers to get heavy laying birds. The phenomenal egg-producers are liable to exhaust themselves with heavy continuous laying during the last of the season.

On this point a breeding author says: "In general, a hen that lays hundred and fifty eggs a year is worth more as a breeder than one which lays several dozen more." How many of the minute horses have been known to beget two-minute offspring? There is a point beyond which phenomenal performance saps the constitution and renders transmission of such extraordinary qualities impossible. Compare the pen of the best, most typical, strongest birds obtainable and many eggs will result than in any other way. My prize-winning hens and pullets are my best-laying birds.

In selecting and mating our breeding pen we must also consider the relationship of the birds. The question is, shall we mate related birds or those which are of different blood?

In my own yards, I have three different strains of White Leghorns, all of which have been carefully bred for years and many undesirable qualities "bred out" of each strain, so that I do not have to "inbreed."

Continued on Page 576

Single Comb Buff Orpingtons

BY W. S. SULLIVAN, AGNEW.
Written especially for the Cultivator

Mr. Sullivan was one of the first to take up the breeding of Buff Orpingtons, and his experience covers many years. He gives special attention to the utility as well as to the fancy points.—Ed.

IN THE Keeping of any variety of fowls where a revenue from them is the chief reason for maintaining a flock, the owner adopts his or her particular breed because of some qualities that appeal strongly to him. Many beginning in this line seek fowls for eggs alone, others finding a market for dressed carcasses need a bird with ample proportions that shall look well when their usefulness as layers shall have passed and they be turned to market. The strictly fancy or ornamental breeds are fast giving place to those that can be depended upon to give a return in dollars for the care bestowed. As many are engaging in the poultry business, a listing of the good qualities of each breeder's particular variety may be a help in selecting the one that may be best adapted to the wants of some inquirer. Location, feeds, available transportation and room to be commanded, all have to be considered in the selecting of the breed that shall be the one deemed best for the individual's particular use. Every breeder has his reasons for keeping

Hardy. Many parts of England the climate is damp and foggy, which is a trying condition on all classes of poultry, and as a bird originating in such a climate must have resisting qualities to hold them against the dreaded roup and kindred disorders of chickens, they appealed to the writer strongly. We are located where there is at times fog and dampness, but we have never had our flock out of condition from this and have found them the personification of health itself. Our birds have been shipped all over the country, from Montana to Arizona, and Honolulu, H. I. At the latter place they won in the show room after the sea voyage. From all localities alike come good reports of health and egg production. The Orpingtons, while not a non-sitting breed; are easily broken when broody, which fact makes them the layers they are, usually being cured in three or four days after changing the run and laying again in ten days. As a sample of the value of this breed when too old to be kept longer for egg-

A Fine Pair of Orpingtons.

his particular breed. The writer has his. Those keeping other kinds find their variety suited to them and among us all the one seeking to produce more of what California is sadly in need of—eggs and poultry meat—will find what will suit him best from descriptions given of our breeds as we find them.

History.

The history of the Orpingtons has been so often given that it is hardly necessary to mention it, but a brief description of them may be new to some; they are the result of mating together of the Buff Cochins, Golden Spangled Hamburg, and the old English Dorking, giving us a bird that has more than fulfilled the expectations of those who have adopted them for the quantities which Mr. William Cook of Kent, England, endeavored to combine. That is, large size with the egg producing qualities of the lighter breeds. The 200-egg hen is as common today among this breed, where they have been bred for eggs, as she is among the Mediterranean and just at this time of year it is a pleasure to handle as eggs are above 50 cents per dozen. They run into money very fast beside giving one the opportunity to hatch the early chick, which is always the one to "do best."

production, the writer finds ready market for all his hens, at from 85 cents to \$1.25 each. Fifteen cents per pound is a common price alive for such as are turned to market. Fertility of eggs is good alike in September or February, and hatching the year around as we do there is never the complaint of lack of eggs. California has imported between \$2,000,000 and \$3,000,000 worth of eggs and poultry meat in a year, any one with even a small lot at the back door and a few, good, pure blooded fowls might have a few of those dollars for themselves here at home.

Mr. H. C. Decker, of Burbank, made us a call today to renew his subscription to the Cultivator for at least the tenth time, he having first subscribed for the Cultivator "back East" over ten years ago. He says "no rancher can afford to be without the Cultivator, and that many and practical and valuable suggestions are worth many times its price." Josiah Colledge, of Santa Cruz, encloses \$1 for renewal of subscription and says: "I have been a subscriber for eight years, starting the Cultivator when in Corning. I like it very much and shall always be a subscriber to your paper, as it contains so much valuable information on all different topics."

KEEN KUTTER TOOL CABINETS

It is difficult to select a set of tools for the home or farm piece by piece that will exactly cover all requirements. To save the expense of needless tools and always to be sure of having just the tools necessary, select one of the Keen Kutter Tool Cabinets. Then you will have as good a set of tools, kept in as good condition, as the expert tool user.

Every tool belongs to the famous Keen Kutter brand, and is sharpened, tested, inspected and guaranteed perfect before it is sent out.

Keen Kutter Tool Cabinets are the only ones made containing a set of tools under one name, trademark and guarantee. Prices from \$3.50 to \$85.00. If not at your dealer's, write us.

ADMITTED IT.

As Gen. Benjamin F. Butler entered the lobby of the Boston State-house one morning he saw two men whom he knew engaged in a heated argument. "One moment, general," said one of them to him; "can't you settle a dispute? We were arguing as to who is the greatest lawyer in Massachusetts, and as we can't agree we will leave it to you."

"That's easy. I am," said Butler, with perhaps more truth than modesty.

The two men were somewhat taken aback.

"Er—er—but, general, of course—you know—but—how can we prove it?" the first speaker managed to get out.

"Prove it? Prove it?" growled Butler. "You don't have to prove it. I admit it."

THE LITTLE LEGHORN HEN.

They haint na feathers on their toes, they's yellow, bright an' clean; They haint no top-knot nuther, but a large, red comb is seen. They haint no size to speak of, but they lay so well you see, 'At the little Leghorn hen's big enough for me.

Some finds it discommodin' like, I'm willin' to admit, To hev only Leghorn hens an' they don't want to sit; But I've a patent egg machine an' brooder so you see, 'At the little Leghorn hen's good enough for me.

You kin smile, an' sneer an' giggle, an' turn yer nose up some, An' laugh, an' holler "a Leghorn hen's no bigger 'an my thumb." If big hens suits you better, why you jes keep 'em; I'll agree, But the little Leghorn hen's big enough for me.

"We can't both marry her, so we shall have to come to some understanding."

"What understanding?"

"You take the girl, and I'll have her money."—Frazzli.

Winners of Mission View Poultry Ranch

At the Los Angeles County Poultry Association Show, Dec. 7-14, 1907: White Wyandottes, 1, 2, 4, 5 cks; 1, 2, 3, 4 ckl; 1, 2, 3, 4, 5 hen; 1, 3, 4, 5 pul; 1, 2, 3, 4, 5 pen; Mammoth Bronze Turkey—1 adult, 1, 2, 3 yearling; 1, 2 young tom; 1, 2, 3, 4, 5 hen; 1, 2, 3 pullet. Pekin Ducks—1 old drake, 1 young drake, 1 old duck, 1 young duck. Lakenvelde—1 ck., 1 hen, 1, 2 pullets. Pearl Guinea—1 ckl., 1 pullet.

Out of thirteen possible specials I won ten as follows: The Times cup for best display of White Wyandottes, the Los Angeles Produce Exchange \$50.00 silver cup for best display of table fowl, the Henry Albers loving cup for best pen of White Wyandottes, Harper & Reynolds Company's handsome carving set for best display of White Wyandottes, the Superintendent's cup for best display of any one exhibitor of any one breed, a California incubator for best display of turkeys, the Association cup for best White Wyandottes, the National White Wyandotte Club cup for best Wyandottes, all the National Wyandotte Club ribbons for best cock, cockerel and pullet; and in the competition open to ladies only cut glass vase for hen and ten chicks in a large breed; and cut glass salt and pepper shakers for best bantam hen and five chicks.

I had the largest exhibit of White Wyandottes ever made on the Pacific Coast by any one exhibitor. I raise all my birds and keep forty breeding pens and all my hens are trap-nested.

Barred Rock Ranch Of Chas. E. Smith of Gardena, Cal

Photos and Description by Frank H. Thomas.

TO GET out an issue devoted to poultry and not have a chapter on Barred Rocks, would be like having Thanksgiving dinner without turkey and cranberry sauce, or a circus without "red lemonade."

I often wonder if Mr. Orphum had any premonition of the popularity of the Barred Plymouth Rock when he exhibited and named them away back in 1869. Whether he did or not makes but little material difference

Barred Rock Cock.
In First Breeding Pen.
Owned by C. E. Smith, Gardena, Cal.

now. But it does seem strange that as the Pilgrims were our earliest English settlers and staunchest American citizens, that one of the earliest of the American breed of fowls should be named after the place at which they landed and that they too should prove the most popular and sturdy of all of the American breeds.

The popularity of the Barred Rock reaches from the Atlantic to the Pacific; from the bay to the gulf. They are more widely bred today

Barred Rock Cock.
Los Angeles, 1907.
Owned by C. E. Smith, Gardena, Cal.

than any fowl of any variety known to mankind.

The Barred Rock is a fowl for the farmer who wants a bird to forage and rustle for itself for the market man who wants a rapid-growing, plump carcass for his customers, or the fancier with the most progressive or artistic taste or ideas, the Barred Rock is all that can be desired.

To successfully breed Barred Rocks takes more study, hard work and patience than any other breed in the American standard today. There are but few who seem to have the faculty to establish a strain of these birds that will reproduce themselves

to any marked degree. But in Chas. E. Smith, of Gardena, I found a man who seems to have solved the problem of mating and breeding his birds to such an extent that they will reproduce themselves.

Something over a year ago I visited his ranch. At that time he had good birds, yes, very good, so good, in fact, that I asked myself the question, can he mate those birds so they breed better next year, or is it a chance mating. Last week when I visited his ranch and saw his birds, the question was settled, for he has better birds today than his matings produced last year.

Mr. Smith has made a marked im-

Barred Rock Hen.
In First Breeding Pen For Three Successive Years.

provement in the male birds. His males have a uniformity of color and shape that characterize his strain, and stamp them as one of the leading strains of the Pacific coast. (His hobby seems to be: "Birds barred to the skin with good head points.")

Last year was the first time Mr. Smith ever exhibited at any show, but he was successful. More so than he ever dreamed of. He won more prizes than all other exhibitors combined, and this in the strongest competition ever witnessed on the Pa-

First Prize, Barred Rock Cockerel.
Los Angeles, 1907.
Owned by C. E. Smith, Gardena, Cal.

cific coast, comprising 230 specimens. Winning the coveted prize of a silver cup for the best pen in the show, all breeds competing, beating birds from the yards of the most noted breeders East.

Mr. Smith breeds Barred Rocks on the large scale, having fifteen acres in his ranch, much of it in alfalfa, which affords free range for his young stock, thus ensuring health and vigor.

Any admirer of this breed will be ranch, or if in need of stock or eggs, to correspond with him.

Pigeon Breeding

BY WILBERT E. FOSTER, FILLMORE, CAL.
Written especially for the California Cultivator

No man in California has had more successful experience in breeding pigeons or is better qualified to give the readers of the Cultivator advice on breeding and mating than Mr. Foster.

FROM the uninitiated the query often comes, of what good are pigeons? Then they try to answer the question for themselves, by saying they are only a nuisance and of no good at all. The parties so speaking are generally giving their experience with a few common pigeons tolerated somewhere about the place where they could roost on the harness, shifting for themselves, producing a few measly squabs in a dirty box or set of boxes placed just where they ought not to have been placed.

While I am a lover of pigeons, I will admit that under such conditions they would, indeed, be a great nuisance, and as such be done away with; but on the other hand pigeons can be placed on a paying basis on a small city lot or on a large scale at a suburban home, while on a ranch they can be made to become a valuable asset. In fact, I doubt if there is any more money to be made out of poultry than can be made out of pigeons placed under good management.

There are two purposes for which pigeons are bred: One called mercantile breeding; that is, breeding them to produce squabs for market. The other termed fancy breeding, which is taking some variety and so mating them that each year they will come nearer reaching a recognized ideal. Either purpose, if correctly carried on, will give good financial returns.

Breeding for squabs must be understood for good results; so must breeding for the fancy and, unless one has served his apprenticeship, I would advise him to go slow until he has given the subject some study. The starting of too large a loft by an amateur has often been the rock that sunk the ship of many who would have made a success of the business had they started more moderately.

In squab breeding, the best place to start is on a ranch, not necessarily a

large one, but a place away from the city where there is room for sheds and aviaries. All birds should be confined there according to the understanding one has of the breeding of the pigeon. The start can be made free from molestation of city laws and other hindrances. The situation should, by all means, be near a good market; fifty or even eighty

miles is not too far away. The stock should be chosen for the purpose in view. If for a general squab business at so much a dozen to the ordinary trade, Homers will do. If for select trade, which, of course, always brings a higher price, the Maltese hen, or the Maltese hen crossed on the Runt pigeon will be better.

The houses need not be expensive, but large enough to avoid crowding, and warm enough to be comfortable at all seasons of the year. A good place is to have it so arranged that warm nights it could be left open and on cold nights or stormy weather be closed.

I knew a Homer breeder who sells stock to start others in the squab business who says that a box against a barn wall is all O. K. for squab breeding. But I never knew anyone taking his advice to succeed. The

birds must be comfortable under all kinds of weather.

Fifty pair of birds will do well in a breeding house 10x20, shed-shape, and not less than six feet high at its lowest place; there should be an aviary not less than 20x30 of same height. The young should be taken away at four weeks of age for market, but left longer or until weaned if kept to maturity.

The feed should be a balanced ration of wheat, corn, Kaffir corn and Canada peas, which should be fed in a hopper. Water for drinking, pure and cold should always be given them from a fountain made for such purposes. A pan for baths should

also be handy and used twice each week or oftener, if convenient.

Twice each week, make it once in the forenoon and once in the afternoon, so that each sex can get its bath. The hens set all night and until nearly noon, then the cocks relieve them until evening. The more often a bath can be given the better, but the birds should not be allowed to drink the water to any great extent after bathing begins.

These rules apply in a general way to the fancy breeds, except that so many pairs should not be kept together, as fancy pigeons are, as a rule, more tender and will not stand the crowding and jostling that the squab breeders will. In starting in for fancy birds the first thing to determine is the variety, or varieties you desire to keep. Having decided this, buy your stock from a good

fancier and expect to pay a fair price for it. Don't expect birds to give general satisfaction purchased from huckster dealers and Tom, Dick and Harry. It is better to start with fewer birds and good ones than inferior stock and more of it. I am talking now from a view of making money, and poor stock won't do it. If some one tries to sell you birds at \$1.00 per head and says they are fine, it is better, as a rule, to steer clear of the birds and let him breed them himself. Of course, there are chances where a bargain can be obtained, but family or strain breeding counts. So I say again, buy from a fancier of repute, pay him a fair price and expect good results. Good stock birds cost from \$5.00 to \$25.00 per pair according to variety and the clearness of the points developed in the specimen. For instance, suppose you are buying Pouters; the party with whom you are dickering describes two birds, both black pied; maybe from the same parents. One, he says, is a little close in crescent, little gay on wing and foul in thigh, with good length, slim girth and well set on legs; value \$5.00. The other fair crescent, nice wing marks; thigh, fairly clean, otherwise about like the other bird; value \$15.00. The difference in price is there because of the better marking, and still he might not breed any better than the cheaper bird. But he is more apt to, but it is also influenced by the bird to be mated to it. If money is to be made, as I said before, it cannot be done on cheap stock.

Don't try to keep too many breeds. Confine yourself to a very few. I would advise no more than two varieties. Study their points; how to mate for best results, never mating two birds together with like faults, but cross the faults. A cock being off on one thing with a hen very pronounced in its perfection and off where he is good. This will, in well-bred birds from good families, give a fair per cent of good youngsters. The knowledge of a bird's ancestry is important in mating. That brings us back again to a good loft where you can either see the birds or get a description of them.

Having get properly started, watch

A Fine Poultry Ranch

A Visit to M. E. Dillingham's Abbott Place, Where White and Buff Wyandottes, Golden Sebrights and Buff Cochin Bantams Are Bred for Fancy and for Utility

Photos and Description by Frank H. Thomas.

DRIVING east on Clarence Boulevard from San Gabriel one of the first places to attract attention is Abbott Place, the home of M. E. Dillingham, breeder of White and Buff Wyandottes, Golden Sebrights and Buff Cochin bantams. Abbott Place, comprising ten acres, is admirably situated and arranged for poultry, being set to walnuts

Stock.

When Mr. Dillingham bought his foundation stock he put no limit as to price, the only stipulation being quality. Therefore, in his yards are noted prize winners from such shows as Madison Square Garden, Chicago and the World's Fair at St. Louis. Mr. Dillingham has always been a strong exhibitor at the Coast shows and takes a great interest in the Los Angeles county show.

In White Wyandottes, Mr. Dillingham is especially strong; his birds have the true Wyandotte shape and are pure white. One thing we noticed particularly, was the size of many of his birds being over weight, which is one of the best faults for breeders. His buffs are an even lot, as Mr. Dillingham culls close and only keeps birds that are the right

White Wyandotte Cock
 Owned by M. E. Dillingham, San Gabriel, Cal.

with orange, lemon and small fruit trees for variety.

Back in England for over fifty years the name of Abbott has been prominent as breeders and exhibitors of standard-bred poultry. Therefore, when we mention Abbott Place, fanciers and breeders of standard bred poultry are naturally interested. Several years ago when Mr. Dil-

White Wyandotte Cock
 Owned by M. E. Dillingham, San Gabriel, Cal.

color, always keeping in mind quality and not quantity. We have noticed his birds for several years and each year shows an improvement over the previous year, which proves that he understands the art of mating to produce color and shape.

Sebright Bantams.

In Sebrights is where Mr. Dillingham shines. It may seem strange to

Buff Wyandotte Cock
 Owned by M. E. Dillingham, San Gabriel, Cal.

lingham "took down" with hen fever, he did some figuring and planning that he might lay out a plant that would be second to none in Southern California. He settled on the colony-house plan, and his houses are what we call semi-open-front plan, which gives almost a perfect ventilation. Yards.

In yards Mr. Dillingham has been very liberal in arranging them, as each yard is large, (32x36 feet) giving ample room for his birds. In each yard he has planted a fig, a mulberry and orange tree for shade. The fruit from these trees makes splendid food for the stock. Water is also piped to each yard, thus reducing labor to the minimum. Besides these yards he has larger yards or range sown to alfalfa so arranged that a flock can be turned on range each day, thus adding much to the health and vigor of the flock.

White Wyandotte Hen
 Owned by M. E. Dillingham, San Gabriel, Cal.

some that a man with such miniature proportions as Mr. Dillingham should take such a liking to these little pets. In Goldens we consider he has the strongest line on the Coast, as birds in his yards have won at Madison Square Garden and at the last Los Angeles show, which was the strongest class of Sebrights ever exhibited in the West.

I am glad to be able to present such a number of excellent reproductions of birds made from photos taken of Mr. Dillingham's birds. The cuts were made without any retouching, and show that he has the correct idea of the true type of birds.

Poultry Culture at California Polytechnic School

BY ALFRED LUNN, CALIFORNIA POLYTECHNIC SCHOOL.
Written especially for the California Cultivator

The work which California is doing for its boys and girls in giving practical culture is to be commended and encouraged. That work done by the California Polytechnic School at San Luis Obispo, is the only work of its kind in this State. At this school not only shop work, dairy and general farm work is taught, but a special course in poultry culture is in charge of Mr. Lunn, who writes for us the following article.—Ed.

THE DEPARTMENT for instruction in poultry culture in this school was organized in 1905, and the writer took charge of the department in the fall of 1906.

It might be well at the beginning to tell something of the Polytechnic school, its object and work, for the benefit of those who have not come

Alfred G. Lunn.

poultryman California Polytechnic School

in contact with anyone connected with the school's work. The Polytechnic school is a State institution, and is a secondary school of agriculture, mechanics and household arts, students being admitted after completing the work of the grammar grades, or upon

are not only interesting to him now, but will be of great service to him in after years.

Five Acres to Poultry.

Poultry culture is a part of the agricultural course and all first-year men have to take at least two terms of instruction in this work. For the use of the department the trustees have given about five acres of land, upon which there have been erected different types of colony houses. Each house is in a separate yard 40x180. There is also a feed house, and a brooder house which has been erected in such a way as to enable its being used for brooding during the hatching season and as a laying house during the balance of the year. There is now being constructed an incubator cellar, which, when completed, will be one of the finest in the country. There are also a number of incubators and brooders for the use of the students.

Some Theory—More Practice.

About half of the student's time is devoted to theory in the class room, a number of lectures are also given on the history of the breeds in order that the student may become familiar with the different crosses that were used to produce our standard-bred poultry. Another line of work taken up in the class room is a study of feeds and feeding, and the balancing of

near-by poultry plants where students will be given a chance to see the different methods that are being used on practical plants.

Worth Increasing.

It has been the hope of those connected with the school to increase the agricultural course from three years, as it is now, to four; this would enable us to give poultry culture throughout the three years and a fourth year could be taken by those who wish to go out as poultrymen well-fitted to manage and act as foremen on large plants.

The Only One.

The Polytechnic School is, at the present time the only institution in the State where instruction is being given in poultry culture. The poultry industry should be the leading branch of agriculture, and our poultrymen and poultry associations should co-operate with their State in the upbuilding of the industry. It would be a good plan if a pen of chickens could be placed on the grounds of every country school throughout the State, and in so doing I think would create a love for nature that is so lacking in the average school boy.

GREEN CUT BONE.

One pound of cut bone for a dozen hens once a day, which should not cost over one cent a pound, will produce more eggs than five times as much grain, because the cut bone is complete in egg-making substances, while the grain is largely deficient in many respects. Some persons affirm that it does not pay to procure a bonecutter for small flocks. That is a mistake. Bone-cutters are now cheaper than many ordinary garden tools, and are strong, durable and efficient. The cost of the bone-cutter is soon regained in the increased

California State Poultry Experiment Station, Petaluma, Cal.

examination, which is given on subjects covered by the grammar school.

location.

The school is located about a mile from the town of San Luis Obispo and can be seen from the main line of the Southern Pacific Railroad. For the use of students in agriculture the school owns about three hundred and twenty acres of land, part of which is now under irrigation; there is also an orchard and vineyard. The school also owns a good stock of thoroughbred horses, cattle, hogs and poultry.

Too much cannot be said of the good the school is doing. We have our own State and throughout the United States agricultural colleges, where men are prepared for teaching and for higher work, but here at the Polytechnic School you will find the boys who are to go back to the farm and do the actual work, the boys who are to be the future farmers of our State. The young man who would probably have left school after finishing the grammar grades now has a chance to continue his study and to do things with his hands, things which

are not only interesting to him now, but will be of great service to him in after years. Lectures are also given on mating, breeding, and judging, attention being given to the judging of birds of utility purposes rather than fancy points. Drafting is also a part of the student's class-room work; drawings are made of different types of poultry houses and appliances, also the laying out of poultry plants.

The balancing of the student's time is devoted to practical work in the poultry yards. Each student operates an incubator and rears a brood of chicks; of all this work accurate records are kept and the student has a chance to study different methods of incubating and brooding. Instruction is also given in preparing birds for market; this covers the fattening, different methods of killing, dressing and packing birds so that the best prices can be obtained in the markets.

Caponizing is also taught and each student performs the operation himself.

Poultry plant construction is one of the leading features, and the student is required to lay out and build poultry houses and appliances. To assist in this work excursions will be taken to

number of eggs laid. It is almost indispensable to success, no matter how small the flock, for no one should keep a flock unless fully determined to secure the largest profit possible. The great saving of bones and meat and the utilization of materials that could not be appropriated as food for fowls without their use have given green bone-cutters a place on all well-regulated farms. They are sold at from \$5 to \$10, a price which places them within the reach of all, and they have added to the profits of poultrymen, farmers, butchers and poultry supply houses.—Mirror and Farmer.

Any of our readers can secure a valuable cook book, famous for its recipes for delicious "quick meal" dishes, by writing The Enterprise Mfg. Co., of Pa., 240 Dauphin St., and asking for it. This book, though published to be sold at 25 cents, will be sent free to our readers. It contains more than 200 splendid recipes and many helpful kitchen suggestions.

Starbuck's Barred Plymouth Rocks

We trap next our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens are from 200 egg mothers and are laying fine. We have divided into pens according to the way they are showing up in four months laying. \$2.00 for 13 eggs from first pen, \$1.00 from 2nd, until they have time to make longer records. (Except from one best, \$20 for 13.) Same records for cocks. No Sunday sales or visitors.

Wm. Starbuck & Son, Fullerton

Nineteenth Annual Show

A Corrected List of the Awards Made
at the Exhibit of the L. A. C. P. A.

IT IS, indeed, a pleasure to attend the show of the Los Angeles County Poultry Association now in session in this city and simply watch the expressions on people's faces. I am not carrying the idea, I hope, that the birds on exhibition will not also give pleasure. But for a fact, people seem to get more genuine pleasure from this show than any I ever attended.

Almost invariably they say "well, I never saw so many exceedingly fine birds in one show before." And it is a fact, that alley after alley may be traversed and no poor specimens seen. It's an all 'round good show. So it's a pleasure to look at the people look at the birds.

The show is not so large as that of last year; that is, not as large in numbers of birds. There are only about 1200 entries. Last year it was nearly 2000. But I believe if actual valuation were placed on every bird exhibited this year and those of last year, the valuation of this year's exhibits would excel those of last by as great a percentage as is that of the excess of numbers of last year over this year's numbers.

There are a number of strong points in the show. It has the largest exhibit ever made in the State of one variety by one exhibition. Mrs. Hubbard's exhibit of 150 White Wyandottes or two big two-horse wagon loads is a magnificent showing of our exhibitor's ability.

The exhibit of Bantams is said to excel any yet made on the Coast. They are great in numbers and of high quality. They are all little beauties.

The turkey class is fairly well filled. Ducks and geese are less prominent.

But the cage of song and ornamental birds, which is near the front and in plain view of the passerby, keeps a crowd on the street all the time.

Financially, it's a winner, for the gate money is now rolling in so satisfactorily that Secretary Hubbard smiles as happily as if he had his mustache back.

The officers of the association are: W. L. Sly, president; John D. Mercer, vice-president; Harry E. Rose, treasurer; C. D. Hubbard, secretary.

Tyler's Opinion.

Mr. Tyler, who judged several different varieties, briefly outlined his opinion of the exhibits as follows:

"White Rocks, as a class, were exceptionally good. The old males were the equal of anything I have handled on the Coast in twenty-six years. The females were fine in shape, but would have shown better if the feathers had been more ripe. They were almost perfect in shape, with long keel and back which go to make the fowl of today. The first-prize pullet was fit to go to any show in America. I have never seen anything superior to the first-prize pen.

"The Buff Rocks were mostly shown by one man. They were a good class, even in color, Rock shape, and I believe should be more encouraged on this Coast.

"Blue Andalusians was a small class, but were well up in the standard qual-

ties that make up the Andalusian. This is another breed which I believe should have more encouragement on the Coast, and probably superior to any shown in America. They are a bird that the owner when traveling through the Rivera with his friend met them on their native dunghill where they have known them to have been bred for over 1000 years. Black Spanish are classed with the Mediterranean variety, the Leghorns, Minorcas, and no doubt he is one of the ancestors. There is no question that an egg producer of large white-shelled eggs so admired by the connoisseur for his breakfast table they are winners.

"Twenty-six years I have judged on the Coast, beginning when William Niles and Chicken Brown showed in box back of Agricultural Park. I have followed year by year the progress of the poultry industry, and while we have lots to learn yet, we are getting there, which the present show indicates. I will say the quality of the birds is equal and is a little superior in some classes, especially the ornamental classes, which should be more encouraged by all fanciers, of anything heretofore shown. As a judge of the show, and for many others since '66 I have been in America.

"I would like to see birds classified and should I be again called upon I judge would insist upon having the birds classified, so I will not have to spend so much of my vitality walking about to make comparison."

Judge Thomas Says:

The Cornish Fowl class, consisting of over 70 birds, was by far the best ever exhibited on the Coast, and I believe equal to any ever exhibited in America, as a number of birds were here that had won at many shows in England. The winning birds were the low-down blocky type that only the English know how to breed.

The first-prize cock was the true type of the breed; he was a winner from Manchester, England, before being shipped to America; was broad and massive, yet had the style, finish and carriage of a true exhibition specimen. He was one of the largest-boned birds we ever saw, and as hard as nail. The first cockerel was a son of the first cock; was a grand bird, and the very essence of perfect color. The second cock was an American-bred bird, splendid color, good carriage, ought to make a good breeder. The winning hens and pullets were good, not a bad bird in the lot; large, typical birds.

We are glad that this breed is coming to the front, as they are among our best table fowl and deserve a chance to prove their mettle.

The Golden Sebright Bantams were no doubt the largest and best class ever exhibited at a Coast show. The first cock and first hen both won first at Madison Square Garden show. The first cockerel and first pullet were both California-bred, and were high class specimens, and very small. Taken as a whole, the class was good.

The White Polish Bantams was

large class and contained many good specimens. The first cockerel was very small specimen, and the true Polish type. The first hen was a splendid bird, carrying a large, well-rounded crest.

The Bantam class as a whole contained many good birds, and no doubt was the largest collection of those little pets ever exhibited in California, and made a show of itself.

Barred Rocks Fine.

Mr. Nash, in speaking of the Barred Rock class, which he judged, said: The display was not as large this year as usual, which was probably due to the fact that the price of entry had been advanced from 50 cents to 1 per bird. While this cut out quite good many birds, it eliminated only the class of birds we do not care so much about in the showroom—that is, some of the poorer ones. As a class, here were some very fine birds, as good as would probably be shown anywhere in the West. The hens and pullets averaged much better than the cocks and cockerels. It seems to me that the breeders, generally, make a mistake when they do not show more birds, for very often in their hasty making up of the exhibit they leave one of their best birds at home."

Logue's Classes.

Mr. C. L. Hogue judged several classes of birds, and briefly gave us his opinion of them as follows:

"The Single Comb Black Minorcas were one of the finest classes in the show. We have much better birds than we had last year, and while there are not quite so many exhibited, the quality more than makes up for this. The class of Minorcas is as good as I have ever judged in the show. The first-prize cock has not his equal, I would venture to say, in California, and too much cannot be said for him. The Rose Comb Black Minorcas were a small class and not very good.

"The Buff Wyandottes were a very good class, especially the cock bird. It took the first prize. He was one of the finest birds I ever handled, and the first-prize pullet was an exceptionally good bird. Taken as a whole, they were an even, good exhibit, there being few poor birds in the class.

"The Silver Sebright Bantams were a good a class as I ever had. The first cock and first hen were two splendid birds, and the rest of the exhibit was remarkably good.

"Black Breasted Red Bantams, which was a small class, contained some as good birds as was ever shown here. The first-prize cock I do not think has his equal anywhere, and the first-prize hen and first pen were splendid specimens. They were all good birds, but these three exhibits particularly were worthy of special mention.

"The Buff Cochins were a good class and contained some fine birds. The first pullet was exceptionally good.

"The Partridge Cochin class was a small one, but there were some good birds.

"Black Wyandottes were another small class, but good, especially the first-prize pullet."

"The Red Caps were a small class of very good birds. These are the first to have been shown in Los Angeles for many years.

"Light Brahmas were another rare class, which was made up of some good birds.

"Black Langshans were a good class, it not a large one.

"Brown Red Breasted Game Bantams were the first that were ever shown here, and they were good.

"Taken as whole, the birds in the classes which I judged show a decided improvement over last year's birds, and show that they have had careful breeding and treatment during the past year."

Best Ever.

Mr. Browning of Ogden, Utah, and Mr. H. Berrar, of San José, judged their classes together, and in giving the Cultivator their opinion, both said:

"There were some very fine White Wyandottes, many of which went by unnoticed, owing to condition. White birds should be exhibited white and clean, and not covered with dirt, for few people can tell when birds are all dirty whether they are red, black, or green underneath. There is one thing that the Wyandotte breeders should keep in view, and that is that the Wyandotte is one of the shortest birds that we have, and to keep as far away from the Plymouth Rock shape as possible. There were a number of typical Wyandottes went by unnoticed, which if they had been properly shown would no doubt have been among the winners. Competition is getting too keen to show Wyandottes in a haphazard way. They were a very strong class.

"Buff Orpingtons were not as strong as last year, though containing many birds of quality. The Black Orpingtons were very good, especially in the cocks and cockerels. The type of the Buff Orpingtons was more uniform than any other variety in the show.

"The Rhode Island Reds were a very good class, about the best that has ever been shown in any Southern California show. The first cockerel was one of the best ever shown.

"The Partridge Wyandottes were a fair class.

"Buff Cochins Bantams were a very fine class.

"The Red Pyle Game are really world-beaters, and they are the best ever shown on this Coast, and we believe ever shown in the United States.

"While, of course, the number of exhibits is not so large as last year, due to the increase in price of entry fee, yet the quality, we think, is far superior."

Cannon Poultry Co. 2851 Morgan Ave. Los Angeles, California

One pound of green bones is generally considered sufficient for sixteen hens. Besides the cut bones or oyster shells, the hens must have a generous supply of some kind of grit, very coarse sand or broken crockery.

The busy, happy little hen,
In open field or picket pen,
Goes swinging at her daily toll
To scratch a living from the soil.
She's through the orchard and up the hill,
For seeds and bugs her crop to fill;
And when her daily round is made,
A nice fresh egg she's always laid.

Continued on Page 591

50 Cent Eggs

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

ARTIFICIAL INCUBATION.

Continued from Page 565

greatly cut down the possibilities of a good hatch. They had turned the lamps a little too high once or twice, and the eggs were overheated a little, maybe 108 degrees or 115 degrees, but not long. I am positive the hen never turned her lamp too high. Then they forgot to turn the eggs a few times (possibly all the time, it was too much work;) and still the two percentages were almost equal.

Now, if this is a fair and impartial trial for an incubator, I don't know what fairness is, and as long as people are satisfied with this one-sided comparison, incubators will always be a failure.

If it had not been for the great work the incubator has accomplished hatching chicks, I am afraid poultry would be a novelty, where it now is a common sight, for the consumption everywhere is way in advance of the output.

What the incubator manufacturers need is assistance along the lines of practical information from people who are actually endeavoring to make a success with the hatches, and not from those who are forever finding fault and trying to keep others from mak-

strong female where he is weak.

For example: An undersized male if you must use him, mate to oversized females. If his comb is too large mate to females of small, fine combs. If his legs are not a strong yellow, mate to brilliant yellow-legged females. If his comb is other than right mate to females that offset said defect. If his legs are too short or too long, mate to females with opposite tendency, if possible. So on through the list of requirements, if one has the time and patience to do it.

The easy way is to mate the birds that approach the standard, whose pedigrees are known, and the results will be good. If one has but few birds of good pedigree, and of the true type, keep them separate and breed from them. Add to these, other good birds as circumstances permit.

One can, by careful selection and close attention to details, as outlined, vastly improve any flock with which he may choose to work. The better the birds are to start with the sooner will he attain satisfactory results. By buying good birds one takes advantage of years of careful breeding by the original breeder.

I know of nothing in the breeding line that will respond more quickly

Black Orpington Pen.

ing a success with the very same machine with which they had made a complete failure.—Frank J. Ironmonger, Hollywood.

SELECTING AND MATING A BREEDING PEN.

Continued from Page 568

For the benefit of those who may not have such a wide field to gather their birds from I will say that reading of the books leads me to think that the popular prejudice against inbreeding is perhaps too strong, though of value to breeders with birds to sell.

Here is what Mr. Robinson of Boston says in his great work, entitled "Poultry Craft." Page 154: "The whole matter as well put, in a nutshell, by a writer on cattle breeding when he advises to ignore the fact of relationship altogether, and breed from the best individuals obtainable. Then the question for the poultry breeder is whether he can get, or can afford to get, better birds than he has."

In mating up our breeding pen we must also consider the question of weight. In varieties where the Standard calls for a given weight it will be found advisable to breed from specimens of the weight required or a little over-weight.

In the smaller varieties, where no weight clause is found in the Standard, breed from the largest specimens that are true to type.

Balancing Defects.

In selecting and mating a breeding pen, offset a defect in a male by a

to intelligent work than poultry. On the other hand, I believe that the effects of neglect are as soon noticeable in fowls as in any other line of breeding.

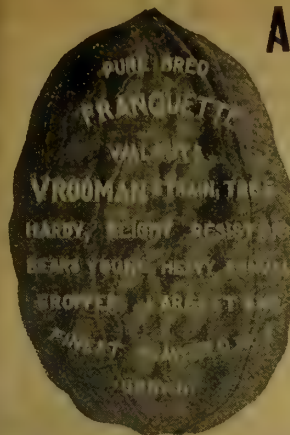

USING TROUGHS IN FEEDING POULTRY.

There are domineering hens in every flock of fowls and these keep the timid ones in fear and subjection to a greater or lesser extent.

When food is given in a trough where the hens can eat their fill, the domineering ones keep some of the others back and often eat twice as much as their share, while the less fortunate ones do not get enough to satisfy either their desires or their needs.

The best way out of this difficulty is not to use troughs at all, but to scatter the grains in some sort of a litter and compel every hen to scratch and hunt for her share, thus giving them all an equal chance. It is better to feed in such a way that the hens must take plenty of time to pick up their food, rather than feed in such a way that they can stuff their crops entirely full in just a few minutes, as they will then digest a larger proportion of the food consumed and with the good exercise they thus secure, will serve to keep them in a good, healthy condition and they will, therefore, be less liable to disease.

Troughs or their equivalent are necessary however, where soft food is fed; but to avoid monopoly by a few it is better to have several small troughs placed at different points than to have only one large trough and put all the feed in this.—Agricultural Epitomist.

Deciduous Fruit Culture

RAISIN SEEDER.

Regarding the new raisin seeder the Fresno Republican says: Many difficulties have been encountered in perfecting this invention, the principal one being that the foundries which could have done some of the work, refused to touch it, presumably on account of influence brought to bear by other seeding concerns. But, by having a few parts made in one place, a few in another and even building some of the important features in his own work-room, Mr. Elliott has evolved this simple, yet effective mechanism entirely different in principle and design to the Pettit patent which has claimed up to this time the exclusive field of the raisin-seeding industry.

Briefly described the machine consists of a circular disc the face of which is covered with pins cast in circular grooves. The disc is composed of 16 segments, which are tongue-and-grooved into each other, being held in place by clamps in the middle and triced by a set screw at the outer rim. Great difficulty was found in getting pins that would stand the strain, but they are now successfully made from No. 17 gauge English Standard plow share cable steel metal by bending and flattening one end so that they will not pull out.

Working against this disc is a conical shaped rubber roller, and it is between this roller and the rapidly revolving disc that the raisins which have been processed are fed into the machine. This has the effect of separating the seed from the pulp, while a knife device situated directly beneath the hub, removes the seed from the disc, dropping them out beneath the machine. A quarter revolution of the disc from this point brings the fruit in contact with a set of metal fingers which lie in the circumferential grooves between the pins, takes it from the tables, where it is cartoned for the market.

As to its capacity for work this machine exceeds those built on the old patents, being capable of seeding from two to three tons per hour. The discs are very durable, calculated to last one or two seasons, making its operation more economical.

With regard to the finished product, not only is the seeding more perfectly accomplished, but the fruit is vastly superior in appearance to that seeded in the old way.

A castiron base is to replace the present wooden support, thereby giving the machine more solidity.

Three machines are now in daily operation and eastern capital is negotiating for the use of Mr. Elliott's patent, thus it begins to be apparent that the raisin-seeding industry has outgrown its days of monopoly.

As a general rule, we should use lime only to correct the acidity of the soil, and this is necessary only where there is difficulty in obtaining a good stand and luxuriant growth of a leguminous crop, such as red clover. As to the form of lime to use for this purpose, the farmer must be governed somewhat by the cost of the material. Fine ground lime stone will be both the best and the most economical form of lime to use wherever it can easily be obtained. If caustic lime be used, we should make special provision to maintain the humus in the soil.

GIVE MORE THAN THEY GET.

I am quite interested in reading most of your articles. I noticed a few weeks ago a writer asked how he could poison rabbits and in last week's paper another man is finding fault because the quail are eating a little of his crop. He is reported to have been breaking the law in trying to prevent the birds from getting a living.

Now, I think that with all the insect pests there are in the country that the birds more than pay for all the grain or fruit they destroy or eat, by the amount of insects they destroy all the year round. Now if these people who are so troubled with rabbits, would start a hunting camp and invite visitors and tourists to come and hunt, they would get a good thing for their trouble of entertaining the sportsmen at a dollar or two a day and have game to eat, as well as thin out the rabbits. They are better eating at this time of year than chicken ever was.

Again, I see some orange growers are stingy enough to begrudge a tourist an orange to eat as they pass along the road. You want to remember that the Eastern visitors leave a large amount of money here in this part of the country every year and the fruit growers ought not to be too hard on the visitors and want to get all they have.—H. Harvey, Pomona.

MECHANICAL CONDITION OF SOILS.

In a German publication discussing the observations of productivity of soils, it is shown that a small amount of silica and calcium carbonate in the soils did not prevent the plant roots from obtaining the necessary amounts of these materials. The so-called silica-loving plants grew vigorously on weathered dolomite rich in lime, provided the porosity of the material was similar to that of the quartz soils. The so-called lime-loving plants grew badly on a calcareous soil which had been rendered very porous by the addition of quartz. They grew well on a siliceous soil which had been rendered compact by the addition of loam and a little calcareous clay.

It seems clear, therefore, that it is the physical and mechanical properties and not the chemical properties which influence the growth and distribution of plants. The difference in growth on sandy soils and on calcareous and clay soils depends solely upon variations in the mechanical condition of the products resulting from the weathering of various soil-forming rocks.

WOOLY APHIS.

At a recent meeting of the San Jose grange in discussing wooly aphis, Horticulturist Morris said that young apple trees could often be saved by submitting the roots to water that had been heated to a temperature of from 130 degrees to 140 degrees. Older trees should be sprayed with a resinous compound, one that would penetrate the wooly covering. Force was necessary in the application, and even pure water would be found beneficial if it were applied forcefully.

ACCESSORY IN DEVELOPMENT.

I am very much pleased with the Cultivator. It is an accessory in the development of our great State.—J. A. Cover, Modesto.

POULTRY IN CALIFORNIA.

One of the really big industries of California is that of poultry raising. The climatic conditions are such that with ordinary care, poultry may be made to return handsome profits. There is never a time when eggs are not in demand at good prices, and poultry for the table is almost a luxury.

The report of the Secretary of Agriculture shows the poultry industry for 1907 to be \$600,000,000 in value throughout the country at large, which is in excess of the wheat crop, also the cotton crop.

Properly cared for chickens, turkeys, ducks and pigeons, go far in making any ranch profitable. In this State we receive, at least, 25 per cent. more for eggs, and 15 per cent. more for poultry products than is received in the markets of Chicago and New York. We ought to raise our full complement of poultry without having it shipped in from the eastern States. The time will come when this will be the case—and the day is not far off.

Even on city lots, owners may raise enough poultry to supply the family with meat and eggs, but this will not be done until more care is taken with the birds. The trouble with the city owner of poultry is in the neglect shown the birds. They require attention; regularity in feeding, watering,

and keeping quarters clean and free from vermin.

We know one woman who has paid for her home, on an acre of ground, in four years. She has simply taken care of her birds, and satisfactory financial results naturally followed.

To succeed in the poultry industry one must read good papers devoted to the care of chickens and follow the advice given on the subject.

Such a paper is the Cultivator.

THE PRESIDENT'S MESSAGE.

President Roosevelt's annual message to Congress, and the country, is in no sense the sensational document his enemies prophesied it would be. It dealt in earnest terms with those subjects which he has heretofore discussed, not receding in the least from the position taken for the necessity of honesty in business methods, square dealing by corporations, banks and allied business interests.

If the trusts and combines expected an abatement of his zeal in the matter of their observance of the laws of the land, they were disappointed. He is as firm in his demand that they shall obey the law as he was when he authorized the Attorney-General to prosecute all offenders against the statutes of the nation.

Eminently wise is his suggestion that the country has reached a point in its development when the tariff may be reduced on certain articles which have become a burden to the producers of the country.

To admit wood pulp free of duty, to take the tariff from lumber would be a blessing to publishers, to manufacturers and home builders. We have come to a parting of the ways on the tariff, as it affects the people, and Congress must note the fact or its political complexion will be changed. We do not mean that the country wants free trade, as a fundamental proposition, but it does demand a modification of duty along lines which most clearly affect the industrial conditions of the present day.

"We need more battleships with their auxiliaries," says the President, "if we are to maintain our place among the great naval powers of the world." So we do.

This recommendation is wise in view of the attitude of Japan, with whom it is feared we must contend for supremacy on the Pacific Ocean at no distant day. Whether such an unfortunate situation shall ever materialize, or not, the old saying: "In time of peace prepare for war," is not a bad one to remember when we are confronted with ambitious, pugnacious competitors who are zealous in their endeavors to control the maritime interests of the world.

Equally sound are his suggestions in relation to the business conditions of the country. We have abundant opportunity for good business conditions. There is no necessity for industrial stringency. We have money enough to transact the business of the nation, but we have "indigestion," that is all, and when this spasm passes off we shall resume our wonted course and renew our unprecedented prosperity.

Taken as a whole, the message reflects the sober judgment of a thinking American, and if the recommendations it contains shall be acted on, in the spirit in which they are given, we shall speedily be given a return of confidence, and we will go on our way happy and contented.

ABOUT BANK DEPOSITS.

The currency stringency of the times has had one peculiar effect, if we may accept the statements of bankers throughout the country; it has increased bank deposits and caused people who heretofore have not been depositors to open accounts in order to avail themselves of the convenience of paying their bills by means of checks. This applies to farmers as well as to city people, because the currency shortage affects the rural districts just as much as it does the big financial centers.

In this connection the Journal of Agriculture points out the fact that:

"Checks drawn by reliable business firms are equally as valuable as cash, but they should not be kept for any great length of time. It is much safer to deposit them in some bank that is known to be solid and where the depositor will be given credit for having deposited an equivalent amount of cash. The mistake of holding checks for an indefinite period can easily be seen, Granting that

Shop Talk

It has been the custom of the CULTIVATOR to issue special editions during each year, devoted to stock, poultry, deciduous fruits, citrus fruits, irrigation and gardening, of which this issue and our recent stock special are samples. Each is of particular value to those interested in the branch treated.

This issue represents a great amount of special work along the line of raising and care of poultry, and is worth to every man, many times the price of a year's subscription. There is a vast stock of information and good reading contained which will circulate far and wide among more people than any such paper in the West ever did before.

Early in January will come the deciduous number, which will be of particular interest to fruit growers. The buying and planting time will be coming soon after that and there will be a great number of things of interest along this line.

The other specials will follow along in their proper season and you cannot afford to miss them, nor any of the regular issues between.

On another page is an order blank which you had better fill out today for the year 1908, or if an old subscriber send in your renewal.

The CULTIVATOR is forging ahead and you had better go along with it.

When renewing your subscription to the CULTIVATOR do not be disappointed if you do not get a receipt by mail for your money. Our method of letting you know your account is credited is by changing the date on the address label on the cover of the paper. For instance, if \$1.00 is paid and your label formerly read 10-07, it will within two weeks change to 10-08. If it does not change in that time we want you to write to us.

the individual or firm that drew the check had ample funds in the bank to pay it at the time the check was issued, it does not necessarily follow that they will have that much money on deposit a year or six months hence. Most States have laws requiring that checks must be cashed within a certain time after they are drawn, otherwise they become valueless. This is perfectly proper, because nobody knows what will happen to a firm's credit within that length of time. The money is there for the person to whom the check is made payable, at the time it is drawn, but if he waits several months before cashing or depositing it, it is not unreasonable to suppose that the firm may exhaust or withdraw its account within that time. Then, of course, when the check is presented, it would be refused "for lack of funds."

"That is where bank depositors have an advantage over others in these times of stringent currency. When they receive checks in payment, they can deposit them to their credit and draw their own checks against such an account, thus making the checks a substitute for real money. 'Another reason why farmers and other persons should have checking accounts at banks,' says the Journal of Agriculture, 'is that a check is a positive receipt in itself and it can be conveniently mailed, obviating the necessity and expense of buying drafts and money orders. If it is dangerous to keep checks in one's possession, it is doubly so to retain cash in any considerable amount, thus inviting the invasion of one's home by robbers.'"

In another way would we suggest to farmers the advantage of bank deposits; prompt payment of all bills owing, for if any bank should prove to be unsound and an account is paid by check, accepted by a creditor, no further trouble can be made the giver of the check. Pay debts promptly and do not hoard money in these times.

PINEAPPLE CULTURE.

Many old-time readers of the Cultivator will recall the name of Goodwin & Thomas which used to stand at the head of the editorial column. Mr. Thomas sold his interest something over ten years ago and went to Wahiawa, in the Hawaiian Islands (about 20 miles from Honolulu,) where he became interested in pineapple culture. He now has over 400 acres planted in pineapples. A few years since, while in Los Angeles, Mr. Thomas gave Cultivator readers an article on pineapple culture. Since then this industry has made great strides on the islands, and Mr. Thomas will write us another article which will be illustrated with scenes on the plantation.

Mr. Thomas's health is far better than when connected with the Cultivator, and his friends hardly recognize him as they meet him, because of his more rugged appearance.

Agricultural Notes of the Pacific Coast

Northern California

Maywood Colony is installing a number of new pumping plants.

There are in the neighborhood of Anderson nearly 700 acres in prunes.

Olive pickling is one of principal occupations at Yuba City at this time.

Gridley Herald reports very profitable dairying interest in that vicinity.

Systematic band of horse thieves are working among the farmers near Red Bluff.

One farmer near Gridley is contemplating planting 3000 acres of corn next season.

Healdsburg shipped 84 cars of tomatoes to the cannery at Santa Rosa during the past season.

Forest rangers of the Stanislaus Forest Reserve held a meeting at Nevada City last week.

A poultry woman of Colusa received from twenty hens during the past twelve months 2900 eggs.

Many grain growers at Red Bluff are forsaking wheat growing and giving more land to the production of stock.

Farmers about Petaluma are taking great interest in the coming poultry show, which promises to be a great success.

The Colusa grain growers have been showing some exceedingly fine specimens of barley grown near that place this season.

The lateness of the rainy season is favorable to the protection work being done on the levees along the Sacramento River.

Ukiah is shipping out a fine bunch of beef cattle at this time. One shipment last week of forty head averaged 1165 pounds each.

One grape grower at Lodi, from a vineyard of twenty-five acres, took 17,000 crates of grapes for which he received 95c per crate.

The recent Farmers' Institute at Rumsey gave special attention to remedies for peach blight, and all told was a most helpful institute.

Farmers' Institute was held at Two Rock Monday and Tuesday of last week. Profs. Jaffa and Woodworth of the university made addresses.

The butter-wrapping machine at the recent Creamery Convention held at Davisville attracted much attention from various creamery operators.

The growing of English walnuts is proving profitable in many sections of the Sacramento Valley. Franquette is proving to be one of the favorites.

The fruit and vegetable men near San Francisco are rejoiced over the announcement that a free market will soon be given them in San Francisco.

Several Healdsburg growers disposed of their hops to one buyer last week, the highest price being 6¼ cents, ranging from that down to 5 cents.

Much alfalfa ground is being plowed up at Yuba City to make way for vineyard planting. One firm there will plant nearly 500,000 cuttings this season.

The Mendocino Vineyard Association has filed its articles of incorporation. It will engage in planting vineyards in Mendocino county, especially near Ukiah.

Central California

Hanford market was supplied with Thanksgiving raspberries, which bore the home-made brand.

Fertilizer Expert Reed of the Department of Agriculture is making soil investigations at Watsonville.

Some oranges were hauled across country from Lindsay to Visalia in order to get Santa Fe shipment.

Dinuba table-grape shippers found the season most profitable, some of the growers securing over \$2000 per car.

A company with a million-dollar capital has been formed for the construction of a cold storage at Watsonville.

More resistant grapevines will be planted this season than heretofore.

Ceres holds a farmers' institute this week.

The second annual fair of the Tulare County Citrus Fair Association closed last week after a most successful season.

The Sentinel says the recent exhibition of poultry at Kings County Fair shows the improvement of poultry of that section.

The annual show of the Fresno Poultry Association is being held this week. The entries will be larger than they were last year.

Investigations are being made in a cement deposit at Watsonville, which it is hoped has the capacity for producing a fine quality of cement.

The Republican says the demand for raisins is improving, and it is anticipated that December and January shipments will be encouraging.

Farmers at Watsonville have been prevented from marketing their potato crop this year on the account of shortage of labor at gathering time.

The Kern county corn growers have found this a most successful season, as the gradually approaching cool weather favored the ripening of the crops.

Raisin packers in Fresno report the inquiry for this season's pack is beginning to look up and promise is now better than at any time since the recent flurry.

The Lewis Asparagus & Fruit Company has filed articles of incorporation. This company will acquire land near Corcoran and grow asparagus, vegetables and fruit.

State Horticultural Commissioner Jeffrey, in examining the white fly conditions in Oroville, expresses a hope that the pest will be entirely eradicated, and says that the whole force of the State office will be used to that end.

A meeting of hop growers was held in Sacramento last week to perfect an organization modeled after the plan of the cotton growers of the Southern States. It is to be hoped that the market conditions may be controlled better than they were this year.

A. H. Hulbert, living in Granite Creek Cañon, three and one-half miles northeast of Santa Cruz, has eight rows of strawberries ninety feet long from which he has sold \$260.80 worth of fine strawberries the past season. The last picking was made November 20.

Southern California

Profits from peanut culture in Orange county have been satisfactory.

Orange ships 200 sacks of green peas daily to the Los Angeles market.

The city of San Bernardino is preparing to set out quite a large acreage of eucalyptus.

A thousand acres of Malaga grapevines will be planted in Coachella Valley this fall.

Hemet navels are very fine this year, the first holiday shipments going forward on Nov. 20.

San Jacinto boasts a single vine which produced this season nearly one ton of citron melon.

Imperial Valley is fattening hogs on "second-crop" products raised after cantaloupes were removed.

Melon growers from Rocky Ford, Colo., inspected the melon prospects in Imperial Valley last week.

The Redlands Review reports that its holiday output of oranges is running 88 per cent. extra fancy.

Up to the end of November Riverside shipped 68 cars of holiday oranges, and 45 cars of lemons.

Many Southern California turkey raisers were disappointed in the Thanksgiving market this year.

Robert Grauer of Oxnard has just returned from a tour in Germany inspecting denatured alcohol plants.

The Submarine says that the orange trees have done exceptionally well in that section during the past season.

The El Centro creamery started recently with a production of 300 pounds per day. Its capacity is 1000 pounds.

This is California's banner year for spuds. Many farmers have cleared \$250 per acre as a result of their labors.

Strawberry in the El Modena district are said to be exceptionally fine this year, many running eighteen berries to the box.

Cannery men are looking over the Redlands, San Jacinto, and Hemet sections with the idea of establishing a fruit cannery.

The warm weather of the past few weeks has succeeded in coloring the oranges, and they are being shipped forward rapidly.

Several big cattle ranches in the southern part of Orange county have dipped their cattle for the tick during the past few weeks.

Redlands has an ordinance compelling that all fowls, especially turkeys, offered for sale in its market must be drawn within a reasonable time after being killed.

A carload of fat hogs shipped from Pullman, Wash., the last week in November, brought the farmers only five cents per pound, a drop of two cents over the previous market.

R. P. Cundiff, the Horticultural Commissioner of Riverside county, has been appointed by State Commissioner Jeffrey a special deputy commissioner over Riverside, San Diego and Orange counties.

The directors of the Redlands Golden Orange Association for next year are: F. P. Morrison, president; Chas. R. Paine, vice-president; H. H. Gartin, secretary and general manager; E. G. Judson, A. E. Sterling, George S. Jay, J. W. England.

The Coast

Garfield, Washington, needs more cars to ship its apples.

Fifty thousand bales of hops were shipped from Oregon this year.

Elberton, Washington, shipped eleven hundred tons of prunes this season.

The fruit and truck growers of Bonham, Texas, have organized for mutual profit.

Two-year-old apple trees in North Yakima, Washington, bore heavily this year.

There are more than one thousand acres of English walnuts in Yamhill county, Oregon.

Texas builders complain of the high prices of lumber, which makes building almost prohibitive.

The Deseret Farmer is appealing to Utah farmers to follow the California plan of making hay of barley.

The Portland Oregonian claims the Willamette valley to be the fruit growing section of the world.

Grain growers at Lewistown, Idaho, are shipping but little grain these days owing to currency shortage.

The Farm and Ranch maintains that Texas cotton sells at a premium over that of any other Southern section.

Fruit men at Wenatchee, Washington, held a meeting recently to discuss fruit marketing problems for next year.

The income derived by the ranchers of Coeur d'Alene, Idaho, aggregates \$50,000 from poultry and eggs this year.

A new sugar factory is to be built at Chinook, Montana. Five thousand acres of beets are pledged for next year.

Packing houses in Salem, Oregon, are still packing on prunes, for which the shippers are demanding full price.

A large number of turkeys were condemned in the Spokane market shipped there for the Thanksgiving trade.

Warehouses at Washtucna, Washington, have been closed to receiving any more wheat, because they are filled to their limit.

North Yakima, Wash., is irrigating with water derived from artesian wells, which is giving a good flow in that neighborhood.

The Territorial fair held in Phoenix, Arizona, last week drew cattle men from all over the State to a cattle breeders' convention.

Farmers of Eastern Washington and Northern Idaho are jubilant over the extension of the C. M. & St. P. Railway through that section.

A storage warehouse three miles long at Vollmer, Idaho, which is the largest warehouse in that State, is filled to the rafters with wheat.

It is claimed that a walnut grower in Yamhill county, Oregon, is making a fortune from a 40-acre planting, which he made a few years since.

The Western Stock show will be held at Denver January 20-25. It is claimed over ten thousand of the most prominent stock men of that section will attend.

Economical Spraying

Power Sprayers do the work **quicker**, do it **better** and do it **cheaper**—that is, if you buy the right kind. Some people think an engine hitched to a hand spray pump makes a Power Sprayer, but it is more likely to make a "Peck of Trouble."

Bean Power Sprayers

embody the practical experience of the best growers and contains scores of important details which are absolutely necessary for rapid, thorough work without annoying delays. You know that little things are what cause delays and expense, and it is all such points that five years of experience have eradicated from the **Bean Power Sprayer**.

Every **Bean** outfit is sent out complete, ready for work. Nothing left to fix up. No further supplies needed. It is complete and so simple that no previous experience is required for operating.

How the **pressure** is **kept constantly even**, the **liquid always stirred**, and why **spraying can be done for one-half the cost** of hand pump work, are all questions we shall be pleased to answer.

Call in and let us show you an outfit in operation.

Bean Spray Pump Co.

San Gabriel Garden Co. STRAWBERRY SPECIALISTS

Sunset Phone 276

Grounds, 1 Mile S. E. of Mission

San Gabriel, Cal.

It is not boasting, but simply stating a fact when we say we have had the largest return from strawberries the past season that has ever been recorded. We consider the quality of the plants we used one of the important factors in obtaining this result. Our plants are grown with all the skill and care that forty years' experience can suggest. Write us for leaflet telling how. The Brandywine is the only variety we grow. Plants ready for shipment January 1st, and we do not think it possible to produce better stock that we offer. Intending purchasers cordially invited to inspect our grounds.

PRUNING AND CARE OF LOGAN AND DEWBERRIES.

PRUNE Logan and dewberries any time between now and February.

Cut the canes to a length that will reach to the next plant in the row. Do not leave more than eight canes to the plant and cut all others out entirely. I prefer to leave half of the canes on either side of the plant along the row, rather than lay them all one way. A few pegs or short stakes will help keep the canes in place along the row. I think it a great waste of labor to trellis either Logan or dewberries. In the spring the fruit stalks will all assume an upward growth—seeking the light—and if the weeds are kept out and the new growth that comes up at the crown is properly managed, the fruit can be as easily gathered as upon a trellis and it will be fully as abundant. One way to manage the new growth is to put in a good redwood stake, 11-2x11-2 inches thick and about 5 feet long, and, when the growth starts up vigorously, cut all but eight out of each hill, and when these get so tall that they fall over and cover the fruit, tie them to the stake. The object is to keep them from interfering with the picking, and also to keep them separate from the bearing canes. This separation makes it easy to cut out the bearing canes and clean up the ground as soon as the crop has been harvested.

Another method is to keep the new growth cut back just enough to allow the fruit to be gathered easily. Then after the crop is all gathered, cut out the bearing canes, clean up the ground and allow the new canes to grow at will; first having thinned out the weak or surplus canes.

I have practiced another method with good results, but everything must be done at the right time and in the best manner if it is to be successful. It is to prune back both the old and new wood as above noted, and, not later than July 12th, take a large planter's hoe that has been filed very sharp and cut off all growth close to the ground, haul it off the ground and burn it. You want to be careful to cut with an upward stroke so as not to destroy the buds on the crown of the plant. In other words, don't cut too deep or close. Clean up the ground by a thorough cultivation, and in a few days, when you see the new growth starting freely, give the patch a good irrigation. Thin out each crown to eight canes, and if you give good care by water and cultivation, by the middle of December you will have canes that will bear a fine crop the following season. If it is preferred to use the trellis system, a trellis 18 or 20 inches high, made by setting good posts along the row to that height, and nailing a strip 1x2 inches and 18 inches long flat across the top of the post, and two wires stretched along on top the entire length, seems to me to be the best I have seen. These posts should be about 20 feet apart and the end posts well braced. The wires can be fastened to each cross bar by a staple driven into the end of each. The canes are then brought up to the wire and tied and then bent so that it can be tied several times along the wire to hold it in place.

Dewberries should receive exactly the same treatment. A very successful grower of dewberries in Texas

plants in rows four feet apart and the plants less than two feet in the row. Beginning in the spring he goes over the plants often throughout the season and cuts back every cane to about 12 inches. This makes a great stinky cluster of fruiting canes to each plant, which this grower claims will produce three times the fruit to be had from any other method.

I have not tested this method, but, while it might give a great number of berries, I question if they would have the size of fruit grown with fewer canes to the plant.—Q. A. Lobingier, San Gabriel.

HOW PLANTS PERSPIRE.

"Yes, it is hot," said the farmer, lighting an Egyptian cigarette. He was a farmer of the new type, a scientific farmer, graduate with high honors from a college of agriculture. "Yes, it is hot. My grains and vegetables must be perspiring tons today."

"But grains and vegetables don't perspire."

The farmer's gold front teeth flashed, as he smiled, like a little sun.

"Don't they?" he said. "They do, though. Look at that sunflower there. It is only four feet high, yet on a hot day it perspires two pounds of perspiration."

He waved his silver-headed stick over his fertile fields.

"All that stuff perspires," he said; "beans, peas and corn perspire, during the five warm months, 200 times their own weight. Our perspiration is nothing to that, is it? Imagine me, for instance, a man of 160 pounds, perspiring 32,000 pounds every summer."

"The perspiration of the cabbage is the most profuse of all. Do you know that an acre of cabbage gives off daily in the summer over ten tons of perspiration?—Ex.

Have you ever tried that quick-action vegetable that Englishmen are so fond of—mustard? You can cook the leaves like spinach in 20 days after sowing the seed.

Do you like a salad plant with some "tang" to it? Then sow endive. Tie up the heads so they will

Suckers in the fruit trees do what they will do anywhere else; they will take the life out of the tree and rob it of its fruit.

WHY HE MARRIED HER.

"Her to his heart the fellow takes.

"I've often wondered why."

"Why, don't you know? The woman makes Most luscious apple pie."

LIKED THE STYLE.

She wore a waist of peek-a-boo,

The thinnest she could find.

When the mosquito looked at her

He murmured, "Oh, how kind."

BETTER THAN OTHERS.

The Ornamental Garden

THE SWEET PEA.

Sweet, and everlasting peas are annual and perennial species respectively of Lathyrus, a genus of leguminous plants embracing many species of decorative value as garden plants. Most of the annual species are natives of South Europe and North Africa, the species from which the present garden forms of sweet peas have been raised being Lathyrus odoratus, a native of Sicily. This pea has been in cultivation in gardens for over two hundred years, but its popularity as a valuable garden plant is of comparatively recent date. During the last twenty years a number of horticulturists in England and America have made a special study of sweet peas, and by cross-fertilization and selection have produced varieties of great excellence, the size and form of the blooms and the varied coloring and freedom of flowering in the new varieties arousing a deal of public interest in the plants. The culture of sweet peas has become a feature in most gardens, large and small, the hardiness of the plants, wealth of bloom under fair conditions, ease of culture, and the short period elapsing between the sowing of the seeds and the blooming season being the principal factors in their popularity. The flowers are produced in spring in Victoria, and embrace almost all shades of color; the plants thrive under harsh conditions, but like most florists' flowers, respond well to a little attention in the selection of site, soil and manure and cultivation.

The everlasting peas—so styled on account of their perennial habit of growth—have been found native in various parts of Europe, Asia, and America. As the plants are of herbaceous growth and rest in winter, the flowers of this species are produced in the summer months. Some improved forms of this pea have also been raised; the flowers are rose, white and pink in color and are much larger than sweet peas. The plants are very hardy and are valuable for supplying cut blooms during the hot summer months. There are several species of Lathyrus, in addition to latifolius, that are worthy of a place in our gardens; one of the finest lately distributed in Australia is Lathyrus pubescens, a native of Chili and Ecuador. This is an evergreen perennial climber of very rapid growth, that produces masses of beautiful blooms of a lavender shade of blue, the flowers resembling a well-grown lupin rather than a pea. Plants of this growing in Mr. J. V. Smith's garden, Bundoora, near Melbourne, have covered a large break-wind trellis during their second season of growth; one plant has completely overgrown a space of eight feet in height and fifteen in width and is flowering splendidly. Most of the flowers of this kind are produced in spring, but there are occasional blooms at most seasons of the year. This pea is one of the best of recent plant introductions.

Cultivation.

The most suitable soil for the production of plants of the annual sweet pea that will bloom freely for a long period is a well enriched loam. The plants will grow under severe conditions, but as soon as the plant food

and moisture are exhausted will cease to produce growth and to bloom freely. Soil for the reception of sweet peas should be prepared during summer, a liberal dressing of stable manure deeply worked into the soil being necessary. A light dressing of superphosphate of lime worked into the surface soil, or sown with the seeds, will assist materially in prompting a vigorous growth.

Sweet peas are true annuals, producing flower and seed and dying in one season, and are propagated exclusively from seeds. The seeds will produce plants bearing flowers identical with the parent variety unless artificially cross-fertilized, or by the agency of insects, the latter an unlikely contingency as the organs of reproduction are enclosed in the calyx or keel of the flower. Varieties that have been grown in Victoria for years have never varied from the original type, although grown among other varieties. Seeds should be sown during the autumn to produce strong plants before the winter season arrives, when they will resist any weather conditions that occur in the greater portion of the State. In very cold districts the sowing may be deferred until spring if it is found that the plants will not endure the winter weather. The most common cause of failure to produce satisfactory plants is the sowing of seeds too thickly. Sweet peas may be sown in clumps or in rows at a depth of one inch and six inches of space should be allowed between plants.

The young plants need training on small sticks, when they attain a height of six inches, afterwards being trained on taller stakes, trellis or wire supports. To increase the size and number of flowers the plants should receive a liberal supply of water during dry, spring weather, and will benefit largely by an occasional watering with liquid manure. The flowers should be cut regularly or the season of blooming will be considerably reduced, the production of seed being the signal of cessation of blooming. Plants will flower during the greater part of summer in moist and cool districts and situations.

In addition to the ordinary sweet peas that attain an average height of about six feet, there are two other types known as "Cupid" and "Bush" sweet peas. These are dwarf growing types; the first named grows to a height of only six inches, and the latter eighteen inches. They are useful for edges of borders, but on account of short flower stems are not as popular as the tall varieties.

—Journal of Agriculture of Victoria.

An old dorky who said he was glad he had two boils instead of one gave as his reason: "You see de first one hurts so it makes me forget de secon' and de secon' hurts so I forgets de first." That is why, no doubt, men who use laundry soap for shaving, shave when they have a toothache. But there is no reason why a man should pray for sustaining grace when he starts to shave. He could answer his own prayers and get better help if he would use the right kind of soap—and we mean by the "right" kind (taking his own grandfather's word for it.) Williams' Shaving Soap.

It softens the beard and cools and soothes the irritated skin. "By sending a 2c stamp to the manufacturers, The J. B. Williams Co., Glastonbury, Conn., to pay postage, you can obtain a free sample."

When writing advertisers mention Cultivator

Poultry in the Citrus Orchard

BY MRS. C. D. HUBBARD, SAN FERNANDO.
Written especially for the Cultivator

For the past eight years Mrs. Hubbard has been engaged in raising poultry amongst the citrus trees of the old mission town, and is well fitted by her experiences to give information along this line. Mrs. Hubbard breeds White Wyandotte exclusively and on a very large scale.—Ed.

POULTRY is very beneficial to citrus orchards, as well as profitable. The two branches of work can be carried on very successfully together.

Poultry manure is one of the best fertilizers we have for our citrus orchards. All orchards should value it very highly, knowing its analysis, which is as follows:

Nitrogen, 32½ pounds per ton; Potash, 17½ pounds per ton; Phosphoric acid, 30 pounds per ton; Lime, 40 pounds per ton.

It is worth \$20 per ton at least to any orchardist.

Shade and Protection.

The trees provide shade for the chickens in summer and shelters them from the wind in the winter. The chickens in turn will gather the insects under the trees in the dead leaves, and in scratching under the trees keeps the ground loosened, whereas, if you leave no birds in the orchard to keep the ground loose under the trees, it has to be done by hand or the ground becomes very hard and dry and the trees do not do nearly as well.

If the birds are provided with

green feed, they never try to eat the leaves off the citrus or deciduous fruit trees.

Houses.

Movable houses would be best to use. They can be made four feet wide and eight feet long. The frame should be made substantial, using 3x3 for frame and 1x12-board around bottom. Burlap may be used for the north, east and west side; wire netting for the front, with a burlap curtain to draw down in winter; the roof may be of shake, corrugated iron or roofing paper. Pieces of 1x2 should be nailed on each side of the ends of coops to use as handles in carrying them. This size coop with three perches will hold 24 birds.

Feeding.

If the hopper-feeding method is used, the birds in an orchard are but very little care, providing the water is piped along the edge of orchard.

The beauty of having these two industries together, is that you can raise two crops on the same land at the same time and that if the fruit crop fails you are very sure you can depend upon the chickens.

Tulare County Citrus Fair

THE second annual Tulare County Citrus Fair was held in Lindsay last week and closed on Saturday night with the claim of one of the greatest successes in its line ever held. The experience of last year's fair which was held at Porterville aided in putting this one on a higher plane at the start. Then, Lindsay has some hustlers who started out to do things. The verdict is that they did several of them.

The fair is not exclusively citrus. Citrus fruits were the central attraction, but in addition general display of manufactures, arts, products and even livestock.

In the machinery tent many exhibits of San Francisco and Los Angeles houses were made. Engines and all kinds of irrigation machinery made a very strong exhibit. The main citrus and most other products exhibits were made in a large packing-house on the S. P. Railway, outside of which was erected the large tent for machinery and other exhibits. Regarding the locality displays a writer on the ground says:

"At the extreme north end of the auditorium is the platform for music and speakers. The scenery is an enormous sun of oranges rising from the mountains. Beneath is the Lindsay exhibit. It consists of a large fruit refrigerator car, with wood frame and sides and doors of tangerine oranges. The lettering is of limes. The track is wood, ballasted with talc from the mountains east of Lindsay.

Lemon Cove is represented by a gigantic sunburst, with electric bulbs for the sun and green and white bunting for the rays. On the platform beneath are displayed perfect navel oranges and lemons.

"Porterville has erected a large globe in imitation of the earth. The continents and islands are marked off with tangerine oranges and green lemons. Porterville was the first town in Tulare county to raise oranges, and its

display of this fruit is one of the largest at the fair.

"Exeter presents her display on a large platform, with a pyramid of oranges and grape fruit in the center. Piled all around it are specimens of dried fruits, walnuts, grapes and, of course, more oranges.

"Dinuba, Orosi and Sultana have combined to present a prodigious and unique display from northern Tulare county. Trays and boxes of dried and canned fruits of all kinds show the natural resources of these communities. They are just beginning to produce oranges, and they display samples with no little pride.

"The little orange-growing town of Plano has strung specimens of her fruit in all directions around a small booth. Plano is south of Porterville and is in the direct line of the fast growth of the citrus belt to the southward.

"There are tempting displays of apples from Milo and Hot Springs. Apples are grown in large and paying quantities up in the foothills of Tulare county. Success, a new district east of Porterville, has a small exhibit of choice oranges.

"There are two large tables in the center of the auditorium containing the general display from the whole county. On one of these are the jars of different fruits, which took many first prizes at the recent State Fair at Sacramento. The second is covered with freaks of all kinds. Among these are a large Red Emperor grapevine two years old and hanging heavy with luscious grapes, a pumpkin weighing 180 pounds, enormous oranges, grape fruit and many other wonderful specimens.

"The officers of the fair have provided athletic contests for each afternoon, and literary and musical programmes for each evening. Cash prizes and handsome premiums will be awarded for the best displays of everything shown at the fair. Special trains are being run from all neighboring towns and reduced rates are being allowed.

"The officers of the fair are: G. V. Reed, president; G. S. Berry, vice-president; H. W. Dockham, secretary, and J. H. Turner, assistant secretary. They are being ably seconded by special committees made up of residents of Lindsay."

Green Manuring

Now is the time to plant crops for green manuring. The best crops for this purpose are Vetch, Canadian Field Peas and Fenugreek. For information and prices of the seed write to

Johnson & Musser Seed Company

[113 No. Main St., Los Angeles]

For Gardening, plant Onions, Lettuce, Spinach, Turnips, Beets, Radish, Carrots, Cauliflower and Cabbage.

When writing advertisers, mention Cultivator.

Ducks Thrive in California

Written especially for the California Cultivator
BY A. G. GOODACRE OF COMPTON.

Perhaps no man in Southern California has had more experience with ducks, their mating, breeding and feeding than Mr. Goodacre. We feel the Cultivator readers are fortunate that we have secured this information from one so well informed on this line.—Ed.

THE characteristics and breeding of the various breeds of ducks may make an interesting discussion for a short paper.

Pekin.

This variety, so popular the world over as a market duck, bred by the tens of thousands on large duck farms in the Eastern States, especially along the Atlantic seaboard of Long Island, is a native of China, hence the name. When carefully bred and fed, it can be placed on the market as green ducks (never been in the water) at seven weeks old. But they generally are marketed between eight and ten weeks of age, just before going into adult moult. Drakes weighing five and one-half to six and one-half pounds each, and the ducks often one-half to one pound lighter in weight, selling alive for 10 cents to 16 cents and 18 cents per pound, according to the season of the year. Late winter and early spring bring top prices. Summer prices are too low, as a rule, to produce birds at a profit; prices of dressed ducks (just clean picked) undrawn run from 18 cents to 35 cents, the top prices for a select family or hotel trade. The cost of producing a pound of weight ranges from eight to 12 cents, according to feed stuffs, locality, etc., and if from poor breeding stock, it will cost more on account of mortality and slow growth and

small size. There is all the difference under the sun between good Pekin and just puddle ducks, so-called Pekin, because they happen to be white and have yellow bills and legs.

This variety of duck, however well-bred, as a rule, is not a very heavy layer, running from 40 and 60 eggs per year each up to 200 in very exceptional instances. An average of 80 eggs each for large flocks would be considered good. Their best laying season seems to be from December to June. However, there are those who manage to handle their flocks of ducks with great skill, and get a very heavy egg yield from this variety.

Bran, middlings, cornmeal or cracked corn and beef scrap, ground or soaked barley, are all very satisfactory feeds, and a large percentage of the mash should be green food in some form, or boiled vegetables; fish waste both boiled and raw is one of the most valuable foods it is possible to feed, being strong in phosphates. Unfortunately, when fed to market ducks the meat flavor is impaired and will ruin a fancy trade. But to grow the best and largest stock ducks where such a food can be obtained fresh, it can safely be fed twice a day.

In the East drakes attain the weight of even fourteen pounds, the Standard weight for a drake is eight

pounds. This just shows what can be obtained by careful breeding and heavy feeding; whether such an enormous size is an advantage I am not prepared to say. I think, however, we had better stick closer to Standard weights.

There has been a vast deal of difference of opinion about the ideal shape and type of head and neck of a Pekin. A short, thick head and bill are decidedly objectionable, what are termed "snouty." The head should be long; bill proportionally long and cheek deep; neck rather long and decidedly tapering towards head, but should be massive enough in proportion to body and lightly arched and very thick at base where joining body. The back across shoulders should be very broad indeed, and flat, and carrying good width back to the base of tail; a side view should give a very deep bird carrying its breast well off the ground in front, and in very heavy specimens nearly touching at rear; the shanks must be large and strong to carry such weight, and reddish-orange in color.

Many breeders come to grief in the bill of their Pekin. The bill in the male must always be a clear orange-yellow, positively free from black or horn colored stripes or green spots. It is permissible with the females, especially in aged classes, to allow black or slight foreign color on bills, as ducks when they begin laying well generally have this foreign color, from some unknown cause, appear down their bills. The plumage is white or creamy-white, according to feed and conditions of handling. They are successfully raised without water to swim in, but we believe in

natural conditions where possible.

Other Varieties.

In England the Aylesbury is the chief market duck. It is very white in plumage, with a flesh-colored bill; in carriage, well balanced fore and aft with a keel like a goose; are considered very superior in quality of flesh. Then there is the Rouen, a large slow-maturing duck. The drakes are very handsome, similar to the wild mallard. The Cayuga, a native of New York State, a beautiful greenish-black, a very easy keeper and a splendid table bird. It is a little hard still to breed free from white in neck and breast.

The Black East India, like the Call, is a small attractive bird, kept as an ornamental water fowl; the Blue Sweedish or Blue Orpington, as some tried to call them. They are a very large, bluish-grey bird, and considered a good market duck.

As Layers.

When we come to ducks for layers, there are only two serious competitors: The Indian Runner and the Buff Orpington. As bred to their two separate standards totally different types, but as we see the Runners in California, they are of the same Runners for eggs. Both have proved wonderful producers, but results so much depend on method of handling and feed. Where one party makes a total failure, the next has wonderful success.

There is no question, however, when it comes to looks, as the Buff Orpington is one of the handsomest

TREES

Our Large Nurseries

Experimental Farm, Plant No. 1, 640 Acres.
Nursery and Propagating Department, Plant No. 2, 130 Acres.
General Nursery, Plant No. 3, 640 Acres.
Citrus Nursery and Citrus Orchards, Exeter, Tulare county, 100 Acres.

Every One True to Name

Citrus

Our trees are all grown in the finest soil and under perfect conditions for the production of strong, healthy trees with well developed roots.

Our Citrus Trees

All are grown at Exeter, in the great Thermal Belt of Tulare county. The stock is the very best, and the deep, black soil in which they are grown develops trees with magnificent root systems and fine thrifty tops. Oranges, Lemons, Pomelos, Limes, Citrons in the best varieties.

Our Deciduous Trees

All are grown in a deep, alluvial, river bottom virgin soil; consequently, the root systems are as perfect as good soil can make them. Our assortment of apples, pears, peaches, plums, prunes, apricots, etc., is very complete in all of the best varieties.

Roses and Ornamental Trees

Our rose stock is the finest we have ever grown. Can be supplied in bush and tree form.

We have the largest stock of ornamental trees on the Coast. Order now.

Live Stock and Dairy

IMPROVING THE HERD.

THE common cows of California are of mixed blood, very mixed, so that they are ready to be used for foundation stock for either beef or dairy purposes. They are cow and cow only, and blood strong in either direction pushes them quickly into desired lines. I had no trouble in raising in the second and third generation, good milking cows from common stock when a prepotent dairy sire of registered stock was used at the head of the herd. The cows nearly all reached the three hundred pound mark in the second and third generation. The poorest were, of course, culled out for beef of each generation. Of the third generation there were some that ran as high as four hundred pounds and one old dame that reached over four hundred and fifty every year.

Registered Sires.

I am dwelling on this peculiarity of California cows of going rapidly to either beef or dairy grades when headed by a good sire, because I have been lately talking to some Eastern dairymen. These men express surprise at this flexibility and think it was alfalfa that made it. We reasoned over it for a while, when I found that they were considering that the sire need not be a pure breed one, that a good grade would do as well. The California dairyman that tries to breed up his stock, almost to a man, is doing so by the use of a registered sire. There was where the cows, were thought to show results quicker than in the East. I know that it is a foolish mistake to use any males for breeding purposes that are not full bloods. If the male is not strongly bred into his special purpose, then it is impossible to count on his forcing the offspring of cows, not bred for special purpose, in any known direction. Do not use a grade sire, hoping to improve the milking quality of the heifers. It may do it in one per cent but it is pretty sure to make ninety and nine heintzies. What is a heintzie? Fifty-seven kinds' under one hide.

Three Hundred Pound Cows.

Now, many will say three hundred pounds of butter is not much! I grant you it would not be for a herd of registered cows. Yet, really, is your herd doing it? Have you actually kept the Babcock in use on your herd and counted in every cow milked? Those milked for a short time, and the cows that went to the butchers in the middle of the year! You would really think that the dairyman was afraid of hurting the cows' feeling, the way they will conceal the fact that old Reddy, or young Spot are eating their heads off every year.

Do not in making a record, guess at anything. Do not guess that so many pounds of milk went to the house for the family, or that this milk contained so much butter fat. If you will, stop to estimate, then reason it out. I had a milker tell me that the men's house used five gallons of milk a day, that this would make two pounds of butter more a day for the herd. I went at once and saw the actual amount the men's house had received and found it was two and a quarter gallons instead of five.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

False Estimates.

The high butter content that the milk going to the house is estimated as containing is another source of error. When a herd's milk is testing four per cent the allowance for butter fat in the milk sent to the house is estimated at eight and ten. Why? The wife and children may be the greatest of riches to a man. The milk will not have a single per cent. of butter fat added to it because the richest possession are using it. This buoyancy of spirit, this hopefulness, is commendable now in the time of financial depression. Only do not stir it into your accounts! The bank will not show the balance as any larger and it will make you more extravagant in using money.

Babcock Tests.

The Babcock test is simple enough to be used in every dairy. The cows should always be tagged in the ear. Now, at present, these tags are only used where there are more cows than can readily be known by name. I think it pays to have them in any herd, no matter how small. When milkers are changed, if the cow's number is used instead of a verbal description, there can be no mistakes made as to the cow in question. If I had only two cows, I should have them ear-tagged, for then written instruction as to breeding, feeding and general care can be minutely given. How hard it is often to deal by description was clearly brought out to me by having the foreman and book-keeper letting a dark brown mare run away and then advertising her as

a sorrel. When I asked them why, I found out that all their lives they had called everything not bright bay, black, gray or white, sorrel in a horse. These were intelligent men!

Ear Tags.

Ear tags are made of soft steel of various patterns by different makers. The loop tag of the Dana type seems to be the most satisfactory. The button type of aluminum have also their friends. Sometimes the buttons are too tight and presses on the ear, forming abscesses. When this occurs the button is usually cut off. This takes the end of the ear. Now if one has registered and grade cattle in the same string, the usual way to keep the herds separate is to snip off the end of the ear of every grade calf when it is dropped. This is a mark for life. Now if the end is cut from the ear of a pure bred, then the herd is in confusion. The loop tags often catch in barb wire and are pulled out. This leaves a jagged tear. If it is discovered while the wound is fresh a few stitches make it whole again. The tags should be put in while the cows are young so they will forget the pinch the ear receives when the tags are inserted. When a cow is tagged just before taking the weights of the milk she will be restless and nervous about having the ear taken hold of to read her number. Any nervousness or agitation will affect the milk yield. A cow and a cat are different from a horse or dog. When a horse or dog are ill, they seem to ever remember that you tried to help them. A cow or cat remember it, too, but as a piece of interference or persecution on your

or two as my
neighbors who
are using other
makes, ARE.
DAVID L.
VAN
WORM.

It's "Reliable"

And RELIABILITY is "THE quality of qualities." A reputation for RELIABILITY is not won in a day, a month or a year. Consistent performance during the slow testing of time, alone is sufficient to prove that most satisfactory of qualities—RELIABILITY. Each year for past sixteen years, the

U.S. CREAM SEPARATOR

has been adding to its reputation for RELIABILITY which is UNEQUALLED today. Dairymen today choose the U. S. because they KNOW it can be depended upon to do the Best work ALL the time and the Longest time, too. Time has PROVED it.

Mr. Van Worm's few words sum up completely the many reasons why dairymen everywhere are fast exchanging their old style, unsatisfactory or "cheap" separators for the RELIABLE, clean skimming, up-to-date U. S. If you have one of "the other kind," WE'VE a proposition to make you. Just ask us about it, please.

The thirty illustrations in our new catalog enable you to easily SEE why the construction of the U. S. makes it the most RELIABLE and profitable. Won't you send today for free copy? Just ask for "No. 20."

Whiting Jersey Stock Farm Co. Heber, San Diego Co., Cal

Climax Ensilage Cutters

In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in a much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength and durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half-inch lengths, other feed in proportion. For further particulars, call on or address

O. J. Weber Co. 555-557 South Los Angeles Street
Los Angeles, California

part, and do not thank you in the least. Indeed, rather avoid having you touch them again.

Cow Ledger.

Have a cheaply bound book to use at the barn, for it will become stained and soiled. Put down the milk weight at once. Each cow should be given a page with her number at the top. Then a space ruled for the date, then more spaces three for morning, noon and night milking. Then a space for per cent of butter fat. Leave the rest for any notes on the cow's general condition, or the feed, or anything that is of interest in relation to this particular animal. This is the book also to be used in the testing room. Write across the ruled space when the cow goes dry. Then when she comes in again, give the date, sex of calf and the number it was tagged.

The desk ledger is a well-bound book and into it these records from the barn ledger are copied. On the opposite page, put in the cost of feeding, milking, and the general maintenance cost. This general cost includes everything about the barn and corrals and pasture. This general account can only be made up once a year. If it is not charged to the individual cow as part of her cost, then the place may run at a seeming profit, when fences and barns are tumbling down. It is wonderful how quickly the ledgers cut out wasteful feeding. It also shows the value of grooming, shelter and gentleness in handling the herd. In starting the records of grade herds the heifers, often, do not come up on the grain fed as they should be. In this case the record is left on the barn ledger until it is known definitely that the heifer will remain part of the future herd. Often a poor heifer is one that may have been nervous and then as she was troublesome, the milking stool was used to comb her down. When the nervousness passed these heifers often come out surprisingly well.

Mighty particular? Yes! It pays in dollars and cents. Sometimes, however, people disagree with you on the subject. You have not heard of the man that said to the landlord of the hotel, "I say, landlord, that's a dirty towel for a man to wipe on." Landlord replied with evident amazement, "Well, you're mighty particular. Sixty or seventy of my boarders have wiped on that towel this morning and you are the first that found it dirty."—Mrs. M. E. Sherman.

BARRENNESS.

Barrenness, sterility, or failure to breed in cows and heifers, is due either to imperfect, unnatural, or diseased genital organs.

Imperfection of the genital organs is one of the causes of barrenness, and may be due to an undeveloped womb or imperfect ovaries.

It is usually the case that when a twin heifer and bull calf are born, and the bull proves to be fruitful, the heifer is barren, and vice versa. If this be the case with the heifer, she is not liable to come in heat at all, and is very apt to take on a very masculine appearance, more often having the appearance of a steer than a bull. Even after she has arrived at breeding age the breeding organs are undeveloped and there is no sign of an udder, this being proof of imperfect genital organs.

An animal thus afflicted can never be made to breed.

Wood Sole Shoes for Creamery Men, Farmers and Milkers. O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

An unnatural, swollen and inflamed condition of the genital organs may be brought on by a retention of the afterbirth, this being allowed to be retained in a decomposing condition until it rots away, leaving the mouth of the womb irritated, scalded and sore, so that when it does close, it heals closed so firmly that it cannot be opened without mechanical aid in the form of a dilator.

The genital organs may become diseased from several causes, chief of which is neglect, in cases of retained afterbirth, the same becoming decomposed and converted into matter, causing a catarrhal condition of the mucous membrane of the womb and vagina.

If a cow be served while in this condition, the semen of the bull will be destroyed by this corrosive discharge, thus preventing conception.—Dr. David Roberts, Cattle Specialist, Wisconsin State Veterinarian.

DAIRYING THAT PAYS.

A few farmers make a handsome income from their dairy—many, achieve a moderate success—some, do not begin to make as much money out of their cows as they should. The man who wants to have his cows pay a good profit, and pay this profit all the year round, cannot study the problem too carefully.

One of the most helpful books we have seen on the subject of profitable dairying, has just been received from the Vermont Farm Machine Company, of Bellows Falls, Vermont. In condensed form, it gives facts and figures that will prove extremely interesting to those who are ambitious to find the right way of running a dairy farm. The Vermont Farm Machine Company will send free copies to those of our readers who are interested in the subject.

In order to insure prompt receipt, those who write the Vermont Farm Machine Company might mention this paper.

It is estimated, that in filling the clean by the farmer, so after all clean milk depends on the farmer. silo each cow should be allowed three tons. If the farmer has 30 cows and desires to build a silo, she should build it large enough to hold 90 tons.

See us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Increasing Yield Decreasing Feed

Milk is secreted wholly from food elements given in excess of that required by nature for physical maintenance. Milk production, therefore, is really the result of unnatural feeding.

Man, however, goes yet further and asks the cow to not only consume more food than she needs, but to continue the stuffing process for months when nature would limit the milk-producing period to the brief infancy of the calf. A little thought shows how impossible it is for such conditions to long continue without bringing derangement of bodily functions. Indigestion, loss of appetite and consequent loss of flesh and milk, are common troubles resulting from heavy feeding.

DR HESS STOCK FOOD

is an infallible preventive of and remedy for digestive disorders. It is a tonic, the prescription of Dr. Hess (M.D., D.V.S.) and contains the bitter principles which aid digestion, iron to nourish the blood and nitrates to cleanse the system. Given twice a day in the grain ration, it will cause the largest possible proportion of food to digest, thus increasing yield at an actual lessening (under favorable conditions) of the amount consumed.

Veterinary and medical authorities, like Professors Quitman, Winslow and Finley Dun, endorse the tonics, etc., contained in Dr. Hess Stock Food. It gives a greater appetite for coarse fodder, increases the proportion assimilated and decreases the amount lost; makes steer, hog or sheep fat quickly and cheaply and is the best known tonic remedy for horse ills.

SOLD ON A WRITTEN GUARANTEE.

100 lbs. \$7.00

25-lb pail \$2.00.

Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal compound, and this paper is back of the guarantee.

FREE from the 1st to the 10th of each month—Dr. Hess (M.D., D.V.S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book any time for the asking. Mention this paper.

MILK CANS ROB YOU

Look through a microscope at milk set to cream in pans or cans and you'll see how they rob you. You'll see the caseine—the cheese part—forming a spider web all through the milk. You'll see this web growing thicker and thicker until it forms solid curd. How can you expect all the cream to rise through that? It can't. This

caseine web catches a third to half the cream. You stand that loss just as long as you use pans or cans for they haven't enough skimming force to take out all the cream. But, just the minute you commence using a Sharples Dairy Tubular Cream Separator, you stop that loss.

Sharples Dairy Tubular Cream Separators have 10,000 times more skimming force than pans or cans, and twice as much as any other separator. They get all the cream—get it quick—get it free from dirt and in the best condition for making Gilt Edge Butter. Caseine don't bother the Tubular. The Tubular is positively certain to greatly increase your dairy profits, so write at once for catalog I-260 and our valuable free book, "Business Dairying."

Bloat.

Kindly answer a satisfied subscriber the following question in "Queries and Replies" column. I have a four-year-old cow subject to bloating; particularly so during three or four months before dropping her calf. She is a good milker and is bright and healthy in other respects—gets a variety of food, very little alfalfa or clover. The attacks do not last long, but she is quite often slightly bloated. Lewis Kirkpatrick, Lakeside.

Give her a tablespoonful of baking soda with her grain feed and see that she has plenty of water at all times.

M. E. S.

"Briquettes."

We suppose subscriber wishes to know regarding the machines which bind and cut in small bundles, brush for fuel. Can any subscriber give information?

School Money or Auditor's Fees.

Some months ago a rural school district in the vicinity of Arroyo Grande voted school bonds payable in five years, to erect a new school building. The county supervisors approved of the bond election and sold the bonds at a premium. The county auditor had to make a list of all taxable property within the boundaries of the school district and to allot the interests of the bonded sum plus one-fifth of the principal to the taxpayers of the district as school-bond taxes for next year. This listing and allotting is considered as extra work by the auditor and he sends a bill amounting to five dollars to be paid to his assistants, out of the funds of said school district. But the trustees of the district maintain that the auditor and his assistant draw a good salary from the county for all work connected with their office, and that no school board has a right to spend any of the children's money for doubtful fee bills. Besides, they consider that, since the bond amount be paid each year changes on account of the decreasing interests, and since the taxable property within the district may increase or decrease with every year, there has to be a new allotting of the taxes made each year, and, consequently, the auditor may come in with a like bill for extra work every fall. The auditor threatens the school board with a lawsuit, stating that it is customary to pay for such extra work, but the trustees do not waver from their decision.

Since there are so many cases of bonding school districts for extra expenses occurring every year in our State, it is a question of vital importance to find out if any provisions of our State laws entitle the county auditors for any extra compensation on the part of school districts for the allotting of the school bond taxes. The writer of these lines, therefore, submits the question to the legal adviser of the Cultivator if the trustees of above said school board are right or wrong in refusing to honor such bills.—A. S., Arroyo Grande.

This was submitted to Mr. Fall and his decision is:

The statute makes no provision for the payment of extra charges of above character. It is proper for the board to refuse payment.—L. M. F.

Growing Vetch Seed.

Can you give me any information on growing vetch for seed near Santa

Ana? I have some good alfalfa land on which I would like to try to grow it. This land is a rich black soil and seven miles from the ocean. I understand the seed is shipped in from Oregon. Can you tell me in what part of Oregon it is grown?—A. T., Santa Ana.

Vetch seed can no doubt be grown in this State profitably, though we do not know of any large tracts of land devoted to that purpose. The usual practice is to sow 35 to 50 pounds of vetch with about 30 pounds of wheat to the acre in December or January. The wheat being sown to hold the vetch off the ground so it can be harvested. A loose, sandy soil is better for vetches than the heavy adobe soils.

The present supply of vetch seed comes almost entirely from the Willamette valley in Oregon.

ARE YOU GOING TO BUY?

An incubator or brooder? If so, you want the best you can get for your money—everybody does. All I ask of you is to investigate what I have to offer in this line. If you want to know who has one of our Incubators near you, that you can see, write me. I can tell you an owner of one of them in every town in the State—no matter where you live—there is one of our machines in that vicinity, and if it's there its giving satisfaction—or it would have been sent back. DON'T PAY big prices for Incubators and brooders—prices don't make eggs hatch, the Old Trusty Incubator is the lowest priced Incubator sold today on the Pacific coast. What other machine at any price has, genuine 12-oz. cold rolled copper heater and boiler, double walls, double doors, double top and bottom, nursery drawer, perfect automatic self regulator, smooth clear top, first grade redwood lumber and equal workmanship at anywhere near the same price?

If you can tell me, I want to know. I will buy a few carloads to get the agency. We can and do make the lowest price ever made on this coast on Incubators and Brooders.

We buy several carloads of Incubators at a time, part of these are sold in Oregon, Washington and Idaho by our northern house—that's why we can make the low price. We buy lots of machines and pay spot cash before they leave the factory. If any one or (dealer) doubts this I challenge them to dispute it in the columns of this paper. Also to dispute the fact that we sell more Incubators and Brooders than any dealer in Southern California—bar none. Send for my catalogue and poultry book, 120 pages; it's free. Explains the free trial offer and guarantee we sell on.—E. E. McClanahan, 711 S. Main, Los Angeles.

Experiments with cotton in the Imperial Valley this year have been very promising. One grower at El Centro having quite a large stand during the past season. The fiber is said to be very fine.

Southern California has had excellent returns for its shipments of oranges to England, and it is reported that the shipments this year will be far more liberal this season than in the past.

The Cornish Indian

An Enthusiastic Breeder Who Is Winning With Some Exceptionally Fine Birds.

The Best Table Fowl Grown.

Mr. W. H. Smith of Pasadena is a very enthusiastic breeder of the Cornish fowl. Several years ago he took a liking to this breed, and he was not content until he had a few of these fine birds.

As the Cornish fowl is growing in popularity very rapidly in California, a word as to origin and history might be appreciated.

This breed was commonly called the Indian Game and afterwards the Cornish Indian Game, and are still called the Cornish Indian in some localities. We consider it a mistake to

Cornish Fowl Cock.

First at Santa Ana, Second at Los Angeles, 1907.

Owned by W. H. Smith, Pasadena.

let the name game be attached to them as it prejudiced many who would otherwise have liked and bred them, as they are among our best table fowl.

The Cornish fowl were first exhibited at Crystal Palace and other shows in 1858, but it was practically unknown outside of Cornwall, England, for nearly twenty years after that date.

They were first brought to this country by Adams Thompson, about 1880, who has done much to improve the breed.

When Mr. Smith bought his first pen of these birds, he had a hard time in securing stock to suit him, as he is a very severe critic and used great care in selecting his birds. The cock bird shown herewith is a typical specimen of the breed. He was a first prize winner at Santa Ana, and won second prize at the late Los Angeles show, in the strongest class ever exhibited on the coast, losing only to an imported bird which was a winner at Manchester, England. Mr. Smith also won fourth on him. He is a careful breeder and gives his stock good care and we are glad the Cornish fowls have him as a friend, as he will give much time, work and study in perfecting this breed. He will do much to put them in the front rank, where they belong.

Mr. Smith was one of the charter members of the Pacific Cornish fowl club and is now the first vice-president.

DUCKS.

Continued from Page 583

of the duck family, either male or female. It has beautiful soft and solid body color, fawn or bluish-brown; the drakes having a seal brown breast. No white should appear in plumage.

Muscovy in white and colors are different in habit. Will go to roost with the hens. The colored grow very large, and we used to cross them with Rouens in England to produce enormous table birds; this variety are considered pretty good layers.

The Crested White is more of fair size, with a great tuft of down on the back of the head, giving them more of a peculiar than a pleasing appearance.

The colored Cail is similar in plumage to the wild Mallard and his mate, but the two should not be confused, as the Cail is smaller, and very noisy. A very good distinguishing mark is the decidedly short bill; this is important; it is a breed I am familiar with. The wild Mallard is easily domesticated. We kept a drake pinioned (first joint of wing removed) for 16 years in England, and then he was stolen, together with an Egyptian goose, by some gypsies.

Other very beautiful birds are the Mandarin duck and the American Wood duck. Then again there are a whole host of small fry, too numerous to mention. Sheldrakes and Fantails are easily kept in captivity; the above will show that.

The duck field is large, and herein has been enumerated a wide order to select from, either by the millionaire or just plain duck men.

PAT'S SOLILOQUY.

The strangest idea in the wurruld to me, That is taxin' me noddle at prisent, Is how can a poultryman make it to be, That a chicken is drissed whin it isn't.

An old hen was pecking at some stray carpet tacks in the backyard. "Now, what do you suppose that silly hen is eating those tacks for?" asked Tom. "Perhaps," said his wife, "she's going to lay a carpet." —American Thresherman.

Better
Sausage-
More Lard

Trying to make sausage and lard without the help of the **Enterprise Sausage Stuffer and Lard Press** and the **Enterprise Meat Chopper** is the wrong way; it's a waste of labor, a loss of lard, and the most expensive way in the end. The **Enterprise Sausage Stuffer** shown in cut is a necessity at butchering time. It has a Patented Corrugated Spout which prevents air entering the casing, thus assuring the preservation of the sausage.

The ENTERPRISE SAUSAGE STUFFER and LARD PRESS

always works perfectly. The cylinder and plate are bored and turned to an exact fit, preventing meat working up over the plate. Can be changed to a perfect Lard Press in a minute. Equally useful as a Fruit Press when making wine, jelly, etc. The **Enterprise Meat Chopper** cuts sausage meat just right, as it must be. And whether the meat is tough or tender, it is all cut—not ground. Sold by Hardware Dealers, General Stores, etc. Look for the name "Enterprise" on the machine you buy. Write for the "Enterprising Housekeeper," a valuable book of 200 recipes and kitchen helps. Sent FREE.

Household Department

DOODLE DANDY.

A rooster once in Barnville lived, whose name was Doodle Dandy. His wife—a little Bantam hen—was sweet as honey candy. But roosters are a fickle lot, and Mormonish by custom, A hen is just an awful goose to ever, ever trust 'em! While little Bantam sat at home a hatchin' of her chickens, Old Doodle Dandy strutted round a kickin' up the dickens.

He flirted with the other hens; was bold as you could make 'em, And brought them most expensive worms (that's when he didn't shake 'em.)

At night, hed gen'rally strut back—to sleep at home was handy. He occupied most all the nest, this selfish Doodle Dandy, And ev'ry day at dawn he'll call out "Cock-a-doodle-do,"

Which meant, "Fix up my breakfast, ma'am, and fix it quickly, too!"

At last the little Bantam hen got tired of how he used her, And went and joined the harem of a very decent rooster.

He was a warm-large-hearted bird, and though his wives were twenty,

None of them ever jealous were—he loved them all a plenty.

He warned all of his twenty wives how kindly they must treat her, For 'sides a downright handsome hen, for laying none could beat her.

And now the false ex-hubby is as lonesome as can be;

No decent hen will take the time to fuss with him. D'you see?

And his once cosy, well kept home is now, alas, to let,

For not a soul to keep his house can Doodle Dandy get.

His head is bald, his eyes are bleared, his legs are weak and bandy,

And since he took to drink they cease to call him Doodle Dandy.

—Exchange.

PLUCKING A DUCK.

DEAR Mr. Editor—Did you ever pluck a duck? Well then you ought to try! It's a most exhilarating pastime when you have a fortnight's holiday in the cold weather. You can't do it in the summer; the duck won't keep till you're through.

Last Saturday week morning I was in the middle of sweeping the yard, when the wife called out: "John, dear, how about duck for dinner to-morrow?"

Visions of roast duck and green peas rose up before my eyes, and I seemed to be getting a savory sniff of onions, thyme, marjoram, gravy and the other adjuncts. It was glorious!

"Right you are, darling," I replied, "nothing better."

There was a lovely four-mouths' Muscovy waddling about the yard, so I ran him down, snicked off his head and wired in.

About two hours afterwards one of the youngsters came out to the shed to tell me lunch was ready. Upon taking my seat at the head of the table the wife asked: "Have you nearly finished the duck, John?"

"Well," I replied, "I've shifted a great many of the feathers you can see as he runs about, and only tore the skin in seven places so far."

She seemed worried and muttered something about torn skin spoiling the cooking.

"It's all right, sweet," I said, "he'll go down A1."

About 3 o'clock she herself came out, nicely dressed, and asked me if I was ready to take her for a stroll.

"Why, my own, how can I?" I asked, "I'm only on to the left leg, and there are still the wings, back and neck."

She frowned, turned away, and presently I heard the click of the gate latch. I knew she had gone for her Saturday afternoon walk by herself.

By tea-time I was nearly choked with fluff, and my thumb nail had cut into my first finger in continual savage attacks at the pin feathers. Had run out of tobacco, too. It was maddening! So when little Nellie (she's the five-year-old), asked me to go in to the evening meal, "Don't want any tea," I snapped.

You see, there was a vestry meeting that night, and I swore that the darned duck wouldn't keep me away. So I got a pair of pincers for the pin feathers, and started singeing the fluff with lighted paper. Ye Gods! in about ten seconds the complexion of that duck was a cross between the hue of an Australian aboriginal and a Fijian. I used the scrubbing brush, but it wouldn't come off. Then I swore. You, Mr. Editor, who know me so well, wouldn't believe it, But I really did.

When the wife came out to tell me it was time to go to my vestry meeting, I said: "D—; I mean it's too late to think of it now."

Then she flashed out. "John, you're the slowest man I ever saw, and (she nearly spat this at me,) "the worst-tempered!"

And now, dear editor, I won't continue lacerating your tender heart by recording my further sorrows. I won't tell you how I stayed up till midnight, bullocking away at that Muscovy, and lost my vesty meeting. Nor will I state how I stayed in bed next morning till eleven, while the four walking youngsters worked away at the duck, and the baby jabbed in with a spoon. Nor will I state how these, my own kids, now slight me.

I haven't been to church for two Sundays running. I have been using a fair amount of language lately. I am not a hypocrite, and I hold that a man who is addicted to "language" should absent himself from the house of prayer.

All these things are bearable, but oh! Mr. Editor—I do feel this—SHE is not speaking to me now. But I have not lost hope—I am thinking of you. You are the one individual who can put matters right for me. Well do I know your amiable disposition, your tact, your conciliatory nature. You will put in a word for me! You will explain the difficulties that beset a fellow's path in the way of pinfeathers, fluff, etc.

Come up next Sunday and plead with her on my behalf. Come up and spend the whole day, and for dinner we'll have baked potatoes, cauliflower, and a nice shoulder of mutton—Australian Hen.

"THEY SAY."

"I had rather 'They Say' should tell a lie than myself."—Horace Walpole.

In the bright glare of truth's celestial flame The spirit Ananias could not stay, And leaving blest abodes came here to stray. Fearing the stigma of his ancient name, Straightway he changed it when to earth he came From that of Ananias to "They Say." You can hear him almost every day, Uttering falsehood without any shame. He delights to mingle the crowd among, And circulate slander with mortal tongue.

Being a spirit you can't bring him in To a court of law to answer for his sin. It is best for you to ignore "They Say," Lest Peter may denounce you, too, some day.

ALL RIGHT.

The Cultivator is all right.—Frank Bowen, Glendora.

Seattle San Francisco Los Angeles

Books and Papers

THE PRINCIPLES OF BREEDING.

A book just from the press of Ginn & Co., Boston, will create interest in thremmatology, the science which treats of breeding in its highest sense.

The book is by Eugene Davenport, Dean of the College of Agriculture, Director of the Agricultural Experiment Station and Professor of Thremmatology in the University of Illinois.

Professor Davenport's treatise on this subject of widespread and popular interest is the most comprehensive work of the kind ever attempted. The author is dealing with his specialty, and his experience on the farm and in the laboratory has enabled him not only to understand the problems of the breeder, but also to treat his subject authentically in the light of the latest developments in biological science.

He has presented the science in an entirely new aspect; that is, he has made variation instead of heredity the initial thought. The portion treating of the statistical method of study in heredity is the first of its kind in agricultural literature.

The air of the author is to present a safe and reliable text rather than to construct new theories of evolution. He has adapted his material especially to the student in the junior year of his college course, and to the practical breeder on the farm, care having been taken to present the technical matter in a way easily comprehensible to the student of breeding who may not be familiar with the phraseology of biological literature.

The text, however, is thoroughly scientific in its treatment, and will, therefore, appeal to the student of evolution and of sociology as well.

The Cultivator will deliver to its subscribers at list price, \$3.00.

WHERE THEY DIE ONLY ONCE.

A lumbering old stage was winding in and out over a remote road in the Adirondacks. There was only one passenger, and he had chosen to sit outside beside the driver. Several times he had tried conversation, but had met with so little encouragement that he had given up and was silently watching the landscape.

Presently they came to a tiny mountain burying ground containing a few grave stones and a few unmarked graves. The passenger looked at it, struck by its air of loneliness, which seemed to stir in him afresh the desire for human intercourse. He turned again to the driver, pointed toward the graveyard, and observed:

"People around here don't seem to die very often, do they?"

And without turning his head, "Jest once," said the driver.

NOT TO BE TALKED ABOUT.

"The children were having an object lesson on the guinea pig. The teacher called attention to the short tail, saying: 'You see, it has no tail to speak of.' Shortly afterwards she asked the scholars to write a description of the animal, and a little German girl wound up by saying: 'The guinea pig has a tail, but it must not be talked about.'"—Exchange.

Discontent is the ruin of our ambitions, and content is the cozy little home that we may build from those ruins.

Glowing Heat
From Every Ounce of Fuel

When the mercury drops out of sight, and you just *can't* keep the house warm, you'll find it wonderfully convenient to use a

PERFECTION
Oil Heater

(Equipped with Smokeless Device)

It's very light—carry it about—heat *any* cold room. Turn the wick high or low—no danger—no smoke—no smell. Easily cared for and gives nine hours of cozy comfort at one filling of brass font. Finished in nickel and japan. Every heater warranted.

The Rayo Lamp

with its flood of steady, brilliant light is ideal for the long winter evenings—read or sew by it—won't tire your eyes. Latest improved central draft burner. Made of brass, nickel plated. Every lamp warranted. If your dealer cannot supply the Rayo Lamp or Perfection Oil Heater, write our nearest agency for a descriptive circular.

HOGS WANTED.

WANTED—THREE THOROUGHbred PO-land China boars ready for service. What have you, and at what price? J. A. WAL-TON, Redlands, Cal.

FOR CALIFORNIA.

The magazine "For California" pub-lished by the California Promotion Committee, devotes its entire No-venber issue to the subject of in-tensive farming in the State. Great changes have come over the agri-cultural conditions of California dur-ing recent years. The vast un-divided holdings that of old were given over to grain raising and pasturage have in a great measure been divid-ed up into small tracts of ten, twen-ty or forty acres each. And these small farms are in the hands of farmers of limited means who devote their acreages to varied crops. There is hardly a crop known to either the temperate or the semi-tropical at-titudes that is not wholly at home in the valleys of California.

Thousands of colonists have ar-rived each spring and fall during re-cent years, and this inflow of popula-tion has been principally absorbed by the newly created small farms. Much has been done for this move-ment by the scientific advance of ir-rigation, which has opened up im-mense areas of farming land in every part of the State.

The labor unions of Fresno have started a campaign against the em-ployment of Japanese in the fruit-cur-ing establishments and orchards. This is possibly all right, for the trickiness of the Jap is proverbial, but we must confess that the labor union should be in a position to supply labor to the fruit grower at a reasonable figure be-fore ordering any one else from the field.

F. H. Wilson, the Fresno nursery-man who lives at Dinuba, was doubt-less somewhat "hot" when he learned that forty-five bunches of grapes hung away in paper bags, which he had de-sired for exhibit at the citrus fair, had been stolen by "kids" who had put them in a condition not the best for exhibit.

Excursions were run from all over Central California to the Lindsay Fair last week.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Dec. 11, 1907.

Butter.

Butter quotations in general market are still 67 1/2 for creamery extras, but some sales are now made at 66 or lower with many bids as low as 60 cents. A weak condition prevails on all grades. Lower grade stocks have declined in quotations.

Creamery extra per roll... 67 1/2

Harvesting of beets around Salinas ended before the first of this month.

The Tulare Register says that the Cöoperative Creamery of Tulare won honors at the recent creamery opera-tors' convention. Its butter scored 94 points.

The Horticultural Commission of Monterey county is making a strong fight against the peach blight, and has instructed that all trees be sprayed by Dec. 15.

Some orchards at Watsonville which were on the flats near the river were destroyed by the excessive moisture in the soil at their roots last winter, by the heavy rains.

Several carloads of oranges from Central California have been forward-ed across the Pacific, and it is thought that this will lead to the opening of larger markets in the Orient.

North Ontario Packing Company is paying for its earlier purchases of dried fruits at Hanford, these pay-ments having been held up by the money stringency earlier in the sea-son.

San Francisco Markets

SAN FRANCISCO, Dec. 1907.

Butter.

Butter is off on quotations this week running two cents lower for extras than last week. Most grades are from weak to steady.

The current prices on dairy products in San Francisco are always from 2 to 3 cents higher than the rates given in the daily official list of the Wholesale Dairy Produce Exchange. The retail dealers in this city invariably pay an additional 2 cents per pound on butter and per dozen of eggs, and occasionally it is 3 cents. On cheese the increase is 1 cent per pound. By making these additions to the Dairy Exchange prices the producer in the country can always determine the actual prices ruling in this city. The quotations as prepared by the San Francisco Wholesale Dairy Exchange yesterday were as follows:

California extras per lb.	32½
California firsts	31
California seconds	25
Eastern extras	24½
Storage Cal ex.	27½

Cheese.

California young American fy	16
California flats fancy	15
Eastern fy.	18½
Oregon fancy	15½

Eggs and Poultry.

Eggs are still on the downward trend, though at present quotations the market is fairly firm. But during the week a 6 or 7 cent decline has taken place in the better grades.

The poultry market is not at all strong. The arrival of six cars of Eastern stock Monday had a depressing effect. Quotations are practically as last week, but hard to get top notch.

Fresh ranch eggs	49
Eggs firsts per doz.	42½
Eggs seconds per doz.	27
Eggs thirds	23

Citrus Market

LOS ANGELES, Dec. 11, 1907.

The citrus market shows a much better condition than last week and as the holidays approach there will doubtless be still better sales.

Shipments.

Shipments to date, 1157 cars of which 435 were lemons. Same date last year 489, of which 244 were lemons.

SHOW AWARDS.

The Association Club cups offered on all large breeds and also on Bantams, where classes are filled, had not been awarded at the time of our going to press.

In the hen and chick contest, open to ladies only, the prizes were awarded as follows: Best hen with ten chicks, in a large breed, Mrs. C. D. Hubbard, San Fernando, cut glass vase; best hen with five chicks, Bantam class, Mrs. C. D. Hubbard, San Fernando; cut glass salt and pepper shakers.

Handsome club ribbons were offered by the following clubs: American Orpington Club, National Single Comb Buff Orpington Club, American Buff Leghorn Club, Blue Andalusian Club, American Buff Plymouth Rock Club, American White Plymouth Rock Club, National White Wyandotte Club, Rhode Island Red Club, Cornish Indian Club of America. At the time of our going to press, these special prizes had not been placed and we are, therefore, unable to give the list of winners. Association Club medal honors on both large breeds and bantams had not been awarded.

PIGEON BREEDING FOR PROFIT.

Continued from Page 571.

the young as they grow, keeping the young even in size so one won't push the other back and starve it. This may be done by exchanging birds from one nest to another letting other birds feed them. When the breeding season is over, Oct. 1st, separate the sexes, cocks in one pen, hens in another. Then keep them in good shape. Show them at some one or more exhibitions. Win your share of prizes, advertise your stock, sell at reasonable prices, giving a fair deal. When you get a customer and you are sure to win. It cannot all be done in a day, but like any other business good results follow good business tact. Try it.

The writer of this is at all times ready to answer any questions that may be sent into this paper, or give you any information through its columns that you may require to help you on to success.

Anderson is becoming more and more puffed up with the claim that it is one of the greatest prune sections in the State. Shipments during the past season have been very satisfactory as to returns, and the quality of the fruit is exceptionally fine.

Up to the end of November Oroville shipped 191 cars of oranges.

EGG-CITY INCUBATOR.

The Petaluma Incubator Company of Petaluma, Cal., is placing on the market a line of "Hot-water" Incubators which will be known as the "Egg-City" Incubators.

The Company has been making these machines in a local way for several years and some of the largest poultry ranches of Petaluma, Sebastopol, Stony Point and other places have been equipped with these machines, which in their improved form have been called the "Egg-City" and will be manufactured as regular product henceforth.

The poultry plant of Briemle & Christiansen of Petaluma has been using 14 of the largest size with exceptional good results since 1905, hatching 90 per cent. and 95 per cent.

The "Egg-City" Incubators are made to meet the wants of those who for any reason may prefer "Hot-water" machines but who prefer to continue doing business with the Petaluma Incubator Company, and already the Company has booked orders for all they will be able to turn out for 1907-08.

They are strictly high-grade Incubators of the "Hot-water" system. Nothing is used in their construction but first-class material and the reputation of the Company for the past thirty years in making "Petaluma" Incubators and brooders, the "Standard of the World," is a sufficient guarantee that the "Egg-City" Incubators are the best in their class.

At a recent meeting of the Woodland Creamery Association the following were elected directors for the coming year: H. E. Coil, E. S. Farnham, Daniel Farnham, George Hopkin, J. L. Harlan, S. Lawson and A. W. Morris.

The Tahoe National Forest Reserve has been given many improvements during the last three months. The government has expended a large sum of money in building trails, bridges, and cabins for the rangers.

The walnut crop of Southern California will bring over \$2,000,000 this year. The total output will be over 12,000,000 pounds. This is about 2,000,000 short of last year.

In two days of the last week in November the celery market of orange county made a decided advance. Orders for carload lots are now coming faster than cutting can be done.

The Newbert Protection District, which was formed to reclaim lands from the encroachment of the Santa Ana River, is in a legal tangle which is delaying the work.

Shipments of oranges from the town of Orange and Orange county last year aggregated 718 cars, and 108 cars of lemons. Orange shipped five cars of peanuts last year.

Santa Ana Register says that many Orange county dairies have been "inspected" out of business by Los Angeles Health Board inspectors.

The cabbage crop at Olive will be very large the coming year. Plants which have been reset during the last two weeks are looking well.

The sugar-beet growers at Oxnard are signing contracts for next year's delivery. The acreage will be much larger than any heretofore.

The effects of the early rains have disappeared, and the hills back of Santa Ana were visited by a severe brush fire last week.

Pioneer

Rubber Sanded ROOFING

Always a permanent protection against rain and sun. Spark and cinder proof—does not curl, warp or crack.

Easiest to lay and when once laid is down to stay.

That wear-proof surface of hard flint sand—adds years and years of wear—eliminates the repair bill and requires no painting at any time.

Best for every roof.

ROLL PAPER CO.
LOS ANGELES

The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine straight ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gauge depth to which moldboard should cut. It's a very desirable machine for road-building in city or village. It makes good roads and keeps them so. Although made of steel and malleable iron, still it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveling, Foundation-digging,

For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet, "Delightful Roads." It's free and tells you all about the 20th Century.

The Profits of the Small Farm

THERE is a demand in California for the products of a diversified farm. Thousands of carloads of poultry products, dairy products, livestock, and meats are shipped into California every year. The diversified farm brings in quick, frequent cash returns for the labor expended. The farmer gets cash for his milk from the creamery every thirty days; he gets cash for his poultry products and for his fruits and vegetables. His hogs fatten on skim milk and sell for cash. If the intensive diversified farm be run intelligently, there will be a monthly cash income that will be as regular as a salary, and much more satisfactory than any salary earned by a man who works at desk or counter in the city, for it will carry with it the feeling of ownership in the business which pays the salary, and the further satisfaction that the man who draws the money is his own employer.

There is a wonderful future for intensive farming in California. With the richest soil in the world, and the water which can be impounded to successfully irrigate the soil, there is no limit to its productivity. The day will come when the greater interior valley, the combined Sacramento and San Joaquin valleys, will be given over to intensive farming, and that vast area fifty miles wide by five hundred miles long will be the most productive place on the globe. In the southern part of the State the opportunities for intensive and diversified farming on small ranches are increasing every year with the development, while all along the coast, clear up to the country which was formerly given over to the lumber in-

dustry, small farms are now taking the lead. Coincident with this increase of the number of small farms comes the increased demand for the products raised on them, and with all the increase of production there has been no diminution of the demand; rather has there been an increase in demand and a consequent increase in prices paid for the farm products. With every increase in the population of the farming districts of the State, there is an increase of the city population which calls for the increased supply of farm products.

The expenses of a small diversified farm are small, and one is always certain of having the table necessities. The farmer must have average intelligence and the faculty of application. California is not a shiftless man's country, and to succeed on a small farm or in any industry in this State a man must apply himself to the business at hand. Many a man who has not been able to pay down more than one-fourth of the price of his small farm has achieved entire success with diversified farming, and has paid for the place within two or three years from the proceeds. Many instances might be cited of such success in California. In fact there is scarcely a locality in the State where they may not be found. Hundreds of men in California today are well-to-do who came here with just enough to pay part of the purchase price of their places and get the improvements and stock. These men devoted themselves to diversified intensive farming and are now considered among the substantial citizens of the State.—For California.

A Poultry Essay Contest

One Hundred Premiums Given Away for the Best Essays on Poultry Culture

Every Contestant Receives a Special Prize Worth \$1.50

There are three prizes for the best essays on artificial incubation; viz., 1st prize one B size incubator; 2nd prize, one C size incubator; 3d prize, one A size brooder all o. b. at our factory. Absolutely free.

To each of the two persons contributing the best essay on preparing fowls for the show room, we will give free f. o. b., one of our Automatic Designating Nests.

We will give ten prizes, for best essay on the management and profits of each of the following breeds of fowls; viz., on Wyandotte ten certificates good for ten dollars each at our office on the purchase of one of our B size incubators.

On Plymouth Rocks, ten certificates, good for eight dollars each on the purchase of one of our C size incubators.

On R. I. Reds, ten certificates good for six dollars each on the purchase of one of our A size brooders.

On Leghorns, ten certificates good for six dollars each on the purchase of one of our A size brooders.

On Orpingtons, ten certificates good for four dollars each on the purchase of one of our B size brooders.

On Minorcas, ten certificates, good for four dollars each on the purchase of one of our B size brooders.

On Brahmas, ten certificates good for four dollars each on the purchase of one of our B size brooders.

On turkeys, ten certificates good for one dollar each on the purchase of one of our Automatic Nests.

On ducks, ten certificates good for one dollar each on the purchase of one of our Automatic Nests.

On fattening fowls for the market, five certificates good for four dollars each on the purchase of one of our B size brooders.

These essays must be based on the writer's experience, must not contain more than 500 words and must be written plain with pen and ink.

The essay on artificial incubation must give per cent of eggs hatched, the time of the year the hatch or hatches were made, the size and name of the incubator used, the breed of chicks hatched and the cost of making the hatch.

The conditions of this contest are: That each contestant must inclose with their essay, an order for our Success poultry house floor plans, elevations and full specifications. And our modern poultry plant plans showing the buildings, fruit trees, shrubbery, the comparative cost and profits obtained, together with the small sum of 75c money order.

Our regular prices for these two sets of diagrams and specifications together are \$1.50, or if furnished separately they are \$1.00 each. But during this contest we will send to each contestant the two full sets complete for the nominal sum of 75 cents.

These sets consists of three diagrams, together with full specification; viz., the poultry plant plan 25x17½ inches drawn on a scale of 1-16 of an inch to the foot. The poultry house floor plan and the poultry house front elevation drawn on a scale of 1-4 inch to the foot. A reliable architect would not make these diagrams and specifications for less than ten dollars.

These plans and specifications will be forwarded to each contestant the same day their essay and order is received, and the essay will be filed for examination, which will be done by the awarding committee the next day after this contest closes.

Remember that it does not cost a cash outlay of one cent to make a hatch and brood chicks with our machines; they are as their name implies, a "Success."

These incubators have hatched 96 per cent of the fertile eggs, which is an excellent record for any artificial device for hatching.

Employees or any one connected with our company will not be permitted to compete in this contest.

The certificates of credit awarded to contestant, may be transferred to another party, provided the certificate shall be duly counter-signed by the party to whom it was awarded, and that we are duly notified of the transfer, giving the name and post office address of the party to whom the transfer is made.

The prices of our machines are a little higher than some of the lamp machines but when the expense of oil, the occasional loss and constant danger of fire in using the lamp machines are considered, our (no lamp) machines are by far the cheapest.

The prices of our incubators, brooders and Automatic Nests quoted in this contest, are exactly our regular established prices. Viz.:

Size A, 300-egg incubator complete	\$38.00
" B, 220-egg "	\$32.00
" C, 132-egg "	\$28.00
Size A, 200-chick brooder complete	\$15.00
" B, 100-chick "	\$10.00
The Success Automatic Nests (single)	\$ 3.00
The same in sections of two nests	\$ 5.00
" " " " four nests	\$ 8.00
" " " " six nests	\$10.00

Our object in giving these liberal prizes is to advertise and introduce to the poultrymen and farmers, the "Success" (no lamp) Incubators, Brooders and Automatic Nests, together with the diagram and specifications of our poultry plant and buildings, all of which are acknowledged to be most modern and profitable arrangements for successful poultry farming yet devised.

When writing your essay article, don't be too particular about style or phrases. What we want is a plain statement of facts just as you talk to your neighbors.

Any boy or girl that has helped raise poultry, is just as likely to have a valuable idea on some feature of the work as any one, and any feature whether new or old that will profit to the business will be a strong factor in the essay. This contest closes promptly at 8 p. m. Jan. 20, 1908.

All essays mailed before 8 p. m. Jan. 20th, 1908, will be counted.

Save this Ad; it will not appear again. Name this paper when you write.

An Effort to Reform the Revenue Laws

The Injustice Which Farmers Have Been Subjected to for Generations Should Be Corrected. Any Move to That End Must Be Originated by the Farmer Himself

MR. JOHN TUOHY of Tulare, in an address before the State Farmers' Institute at Davisville, discussed the subject of Reform of the Revenue Laws of this State of California, so intelligently and so conclusively that we herewith present a part of his address, which is in support of the position taken by the Cultivator on this subject, and elaborated on to considerable length editorially in former issues. The subject is important to the farmers of this State and no excuse is necessary for reference to it, either editorially or from quotations made by others who have given the subject intelligent consideration. In the address above referred to Mr. Tuohy says:

"When the present system of taxation for a governmental revenue was adopted, it was agreed that the government should get its revenue by a direct tax on property, as the law defines it. It was assumed that all property, real and personal, having the same marketable value, would contribute the same amount in taxes. However plausible this theory seemed, and it was at that time, our present experience proves it falacious and it always will be, for one class of property, realty, is always visible and incapable of concealment or denial, and the other class of property is not always visible; much of it can be concealed or defied, its ascertainment is always very incomplete. It requires an obnoxious, inquisitorial investigation to get what is found. When found its valuation is much more difficult of determination than is the true market value of realty. It is very manifest, then, that there is an inherent defect in the theory that all property will be revealed and bear its just proportion of taxation. The revenue officers know this full well; nevertheless the law requires them to collect a revenue on these lines, the result being that realty and improvements hereon, which is a part thereof, pays more than our times the tax paid by personality, although in probate courts in the settlement of estates of deceased persons, and in the settlement of insurance losses, insurance is never taken for more than three-fourths of the value of the property in which the risk is written, showing that personality has more than double the market value of realty. This preponderance of valuation, of personality to realty, is incontrovertable, where there is a large diversity of industrial enterprise. It will always exist. Under our system of taxation, no system of obnoxious inquisitorial investigation, and inquisitorial investigation is always obnoxious, nor any system of complex wearing, also obnoxious, will correct it; such things only help to make undesirable citizens."

Two-Thirds in Realty.

"Two-thirds of the farmers' property being in realty, which is at all times in plain sight, he would, if all his personality were exempt (I am not advocating that,) pay more than an equitable amount of taxes. But the formula for the ascertainment of his personal property is more scrutinizing than is the formula for the ascertainment of the property of any other class of taxpayers. This requires a detailed, sworn statement of the number of his fruit boxes, the amount of cheese, butter and honey on hand, fruit graders, fruit dippers, farming utensils, nursery stock, blacksmith tools, wagons, buggies,

carts and other vehicles, hay presses, harness, robes, saddles, etc., stallions, horses, thoroughbred, American, half-breed; colts, one, two and three years old; mules, one, two, three and four years old; jacks, jennies, jack colts, cows, American, thoroughbred, beef cattle, stock cattle, calves, goats, fine and common, sheep, imported, fine, common, lambs, pounds, poultry dozen, hogs pounds, bee hives, wheat tons, rye tons, barley tons, corn tons, hay tons, fruit trays, dry fruit, peaches pounds, prunes pounds, apricots pounds, apples pounds. And all this in excess of the detailed statement required of other property owners. But we farmers have borne it so long, without complaint, the system, unjust and burdensome as it is, is persisted in. The system calls to my mind Lord Byron's admonition, "Hereditary bondsmen know you not he who would be free, himself must strike the blow!" And so it is with us farmers, we must strike

and long and careful study, by the Commission of Revenue and Taxation. It has been presented to the Legislature of the State, has been adopted by it, has been embodied into an amendment to the Constitution, and that amendment is submitted to you, the voters of California, for your approval at the next State election."

"The commission finds that our California system of taxation for State, county and municipality by the same assessment is very defective and has been abandoned by nearly every State in the Union. It recommends that the State shall have a separate revenue system, a system which will draw a revenue from the gross earnings of railroads, and other incorporations, from banks and inheritance taxes, exempting them from all county and municipal taxes, and leaving to the counties and municipalities the taxation of real and personal property for their revenue. The report shows that this is the system of revenue in

quick and hard, for a better, a more equitable system of taxation for State revenue, so far as it relates to us."

"Persons engaged in agriculture pay on the average \$50 per capita each year in taxes out of an average income of about \$500. Persons engaged in manufactures pay on the average \$17.50 per capita each year in taxes out of an average income of \$870.00. The figures on which the foregoing estimates are based were obtained from the United States census report of 1900."

Injustice of the Present System.

"I deem it unnecessary to dwell further on the inadequacy and injustice of the present system for a revenue for the State and the counties. It is condemned in every State. In many States a more equitable and a better system has been devised and is now in practice. It is time that we in California, which in many respects is one of the most progressive States in our Union, formulate and adopt a better system, a system which will be equally just and fair to the members of every industry now here, or which may hereafter come a system of taxation adequate and becoming to the high standard of civilization to which we have attained and which will be a standard of taxation for State, county and municipal revenue which other progressive States can adopt."

"Such a progressive revenue system has been devised, after much painstaking investigation

New York, Pennsylvania, Massachusetts, Connecticut and Michigan and other States. That where it is tried it eliminated friction, is giving general satisfaction, produces an adequate revenue to the State, and by statistics given shows the extent of gain to every county in this State, except three, which under the proposed constitutional amendment will be compensated by the State for any loss, by the change, to them."

"The commission has carefully investigated and computed what will be a fair tax contribution for a State revenue from each incorporation, based on gross earnings, premiums, or stock value, for on gross earnings only can safe estimates be made. The corporations which are required to pay, for the most part, the State revenue, will, also, be benefited, as it relieves them of all county and municipal taxation, or investigation, and makes their contribution easily ascertained."

"It may be that some will doubt, and honestly doubt, the equity of the proposed tax on the gross earnings and incomes of railroads and other public service corporations, but it should not be overlooked that the amounts were arrived at after very careful and painstaking investigation, and even then the Legislature in the proposed amendments, in several cases, cut down the amount. We must reconcile our own views to the views of those selected to investigate and determine these things for us. We will do so."

Citrus Trees

TRUE TO NAME

And embracing all the standard sorts, are to be had of our establishment. Bear in mind that we are the largest growers of Citrus Trees in the world, and that our stock has been awarded the gold medal at every world's fair in the world where we have shown. Hoarding Money

is popular now.

Many have become so conservative that no security is good enough to induce them to part with their funds.

When conditions return to normal much of this hoarded money will be brought out and invested. The opportunity will then be gone to take advantage of the low prices.

Sound securities are safer now than they were when selling at high prices. They yield better interest returns and present an exceptional opportunity for additional profit through advance in price.

Our six per cent coupon mortgages are first liens upon improved city property, and are exceptionally well secured. Intending purchasers may view this security and confirm our estimate of its value. These mortgages are as convertible as Savings Banks deposits, and pay six per cent per annum quarterly interest.

We invite a call or correspondence from those in need of safe and conservative bond or mortgage investments.

With the Citrus Growers

STORY OF THE ORANGE.

FROM a beautiful little booklet entitled "The Story of the Orange," issued by the Salt Lake Railroad, we quote of the story:

Far away in the northern part of India the orange had its origin. How long ago no one can discover. Today India in her Cintra orange undoubtedly has some of the finest fruit to be found in the world. Well-grown specimens have but two or three seeds, the average market specimen weighing about seven ounces. There are five other native varieties grown, while the Malta and St. Michael have been introduced. Budded orange trees in India decay rapidly after the fifteenth year, and seedlings are so slow to bear that they are practically useless for fruit growing.

From India the orange found its way into Western Asia, and thence to Eu-

with fresh fruits. The best varieties then obtainable were planted, but no effort was made to improve them, and the products of those days were in no way comparable with those of the present time.

Vancouver, in his memoir of the Pacific Coast in 1792 relates that oranges were found growing at San Buena Ventura. There is no elaborate mention as to the conditions, merely the statement of this fact. The most extensive orange orchard of the early plantings was at San Gabriel mission in Los Angeles county, California. This was supposed to have been set in 1804 "by one Father Thomas Sanchez." The records of this mission for that period do not show the extent of this orchard, but according to inventories taken of the mission properties at the time of the secularization of the missions in 1834, San Gabriel

rope and into Arabia and Syria, and in the eleventh century to Italy, Sicily and Spain. The introduction into America was made by the Spaniards early in the sixteenth century, and at the present day there are districts in Florida and Mexico which literally are overrun with oranges. Of the introduction into California we find the following accounts:

In 1767 the Jesuits were expelled from the missions in Lower California. Their possessions were turned over to the Franciscans, and Junipero Serra was selected president of the missions. A dispute arose between the Franciscans and Dominicans over the division of the property. The latter claimed an interest in the mission work! in consequence of this, a division was made, and in 1769 the Franciscans started northward, entering and occupying what is now the State of California. The avowed object of their establishment was the conversion of the savage tribes to Christianity; but while devoting themselves to the harvest of souls, the Fathers did not neglect the material interests of themselves or their establishments. The surrounding country was subdued speedily, and the natives were changed from hunters to herdsmen, and the flocks of the missions became numerous and of great value.

This State, together with the whole Pacific Coast, was known then as the Great American Desert. Of the twenty-one missions established, all but three had gardens and orchards. Most of the orchards were small, some consisting of but a few trees. These orchards were planted without regard to their commercial value, the only object in planting them being to furnish the fathers and their servants

mission reported 233 fruit trees upon which no valuation was placed. As this includes all citrus and deciduous fruits, we have no way of knowing whether it was larger than the present area or not.

Outside of the mission plantings a small grove intended for home use was planted by Lois Vignes at Los Angeles in 1834. Another orchard was planted by Manuel Requena in the same year. Of the other plantings which followed, the most important was that of the late William Wolfskill, which consisted of two acres set in 1841, and was probably the first orchard in the State planted with the view to raising oranges for a profit. Other plantings followed, and in 1853 considerable acreage was planted. In 1857 a few trees were planted at old San Bernardino by L. Van Loven from seedlings that were grown by him. He also planted in the same year about forty-five trees that were obtained from Los Angeles. About 200 trees were planted at Crafton in 1865.

The first seeds were planted at Riverside, fifty-seven miles east of Los Angeles, on the Salt Lake Route, in 1870; the first trees planted in the orchard grown from these seeds in 1872-3. The claim is made that at this time there were two old orange trees growing in El Cajon Valley, but there seems to be no data giving any information regarding them. In the northern sections a tree was grown from seed planted in Sacramento about 1855, and transplanted in 1859 to Butte county, where it is still growing.

Don Juan Bandino, who had so much to do with the early history of Riverside, was at one time captain of the San Gabriel mission, and a life

report written in March, 1840, he speaks of the orange grove as being the only one in Southern California, and that he had given it special care, and had restocked it with more than 100 new trees. In 1862, the reports state, there were about 25,000 citrus trees in the entire State, of which the larger number were located near Los Angeles. But after that date the planting increased, and especially after 1873, when an impetus was given to the industry by reason of the building of the Southern Pacific railroad, which facilitated the marketing of the fruit grown.

The first fruit was shipped to San Francisco and to the east over the Southern Pacific line, and brought good returns. The completion of the Santa Fe lines marked the beginning of a boom in orange planting, and the story of returns received in the early days by the growers reads like a tale of Golconda. Some of the returns from orchards of that date were al-

Mr. Chapman, at San Gabriel, was, so far as is known, the first to bring the Valencia Late orange (Tardiff) to Southern California. The trees were brought into Riverside by Alonzo D. Haight, and were planted on his ranch on Palm avenue, in Riverside. The firm of Frost & Burgess introduced into California the Ruby Blood orange. The Mandarin was first introduced into California by Dr. S. R. Magee, and came through the Hon. J. R. Bingham, minister to China, 1882. The buds put out by Mr. Magee did not take well, and as some buds were given to J. E. Cutter gave good results, they were brought out by Mr. Cutter about 1885, and were sent from California to Florida, where they are now grown quite extensively. The Australian Navel was introduced from Australia in 1874 by Lewis Wolfskill of Los Angeles. The claim is made by Australian pomologists that the Australian Navel originally was imported from Bahia, and is the same as the Washington Navel. But the growth in California does not bear out this statement. R. M. Teague of the San Dimas citrus nurseries, informed the writer that the Australian Navel can be produced by allowing the trees to

Courtesy Salt Lake Route

most incredible. It has been reported that as much as \$3000 from one acre has been received, and \$800 to \$1500 was an uncommon yield. Of course, an industry which would pay such profits as eagerly sought, and land suitable for orchards advanced rapidly in value. Other lands advanced correspondingly, and it became profitable to raise oranges. In a few years Southern California became one of the most important sections of the State, and of the Southwest.

As to the date of the introduction of the citrus fruits in Florida, the writer has never investigated. Conditions in Florida being much different from those of Southern California, a large number of varieties are grown there, and orange production is worked on an entirely different scale. Catalogues of the Florida nurserymen list about thirty-three varieties of oranges. The standard varieties grown in Southern California, which we still maintain the true orange belt of the Pacific coast, practically are covered by the Washington Navel, Thompson's Improved Navel, Tardiff, or Valencia Late, Mediterranean Sweet, St. Michael, and some seedlings. Introduction to the various kinds of oranges will be of interest, and while the findings of the writer may not be perfectly accurate, from his talks with old timers and nursery men he believes the following statements are nearly correct:

go back to a primitive state, and that the orange tree is very susceptible to different culture, and that many sorts have been produced. For instance, he now has a tree with black wood, which has never borne an orange.

More from the same pamphlet with history of the navel will be given next week.

MECCA ORANGES.

Regarding raising oranges below sea level out on the Colorado desert, we note this in the Riverside Press:

P. T. Evans last night received by freight from Mecca, a barrel of oranges from the trees planted out on the land of the Peters-Evans-Gage syndicate. The fruit is a valuable object lesson in the possibilities of the desert region as a citrus fruit producing region, and the fruit men and orchardists have today inspected the oranges with a good deal of interest.

The oranges are of the navel variety, of good size and weight and as sweet as the average March navel in this district. The 300 oranges produced this year on the tree are highly colored and firm, but have a flavor distinct from local fruit. The oranges are more like the Florida product, being rather insipid than piquant, as is the Riverside navel. It is unquestionably the earliest fruit ripened in America, being in advance of the Florida oranges and of the Central California fruit.

The syndicate has seventy acres altogether in navels planted out at Mecca and when this district comes into bearing a distinct sensation will be created in Eastern markets.

PUMP IRRIGATION

AN I.H.C. ENGINE
WILL GIVE YOU ALL
THE HEAD YOU CAN
TAKE CARE OF

If you have to depend upon the pump for irrigating your land, you must have a powerful engine.

Formerly irrigation on a large scale by pumping was thought to be impracticable. But that was before the days of the I. H. C. engines.

In building engines for irrigation purposes it is necessary for the designers to take into account the fact that water must be raised in quantities, and that frequently it must be raised to a considerable height.

The use of hundreds of I. H. C. engines by practical irrigators is evidence of how well these requirements have been met, and how well the I. H. C. engines are adapted for this special work.

The engines are not only powerful, but they have the two other absolutely necessary requirements:

They do your pumping economically.

They run dependably with practically no attention.

Irrigators of large tracts of land must have an engine that is economical in fuel consumption. The I. H. C. engines have reduced fuel consumption to a very low minimum.

It isn't necessary to keep an extra man to attend to the engine. Only an occasional return to the engine is necessary, or a small boy can give it all the attention required.

If you have a lake or stream below your land, or ditch, just look into the matter and see how well an I. H. C. engine will solve your irrigating problem.

Vertical engines made in 2 and 3-Horse Power.

Horizontal (portable and stationary), in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

Spraying a Small Orchard

Requires a small spray pump—but a good one. You want just as good fruit as the owners of large orchards who use power sprayers—and you can have it. Any spray pump has done its part when it provides a high, even pressure, keeps the spraying material well stirred, gives no trouble, and works reasonably easy.

Bean's Little Giant Pump

does all this and more. When we say it "keeps the material well stirred" we mean it too, and it's important if you want good fruit. And the "no trouble" feature lets you feel good natured after the days spraying is over. The valves can't clog, the stuffing box can't leak (because there isn't any) and the pump is so simple it is a pleasure to use it. Of course we have good pumps cheaper but **Bean's Little Giant** is altogether the best barrel pump ever offered for spraying small acreage. Also a splendid white-washer

We have samples of these pumps in stock and will be pleased to show them to you.

Bean Spray Pump Co.

161 West Santa Clara St., San Jose, Cal.

Trees That Grow and Bear Fruit

Southern Grown Trees are best. Our trees are thoroughly dormant and acclimated to this southern country. Largest assortment of nursery stock in Southern California. Write us for price list; it is free.

CHRIST AND CHRISTMAS.

In this utilitarian age we are not to forget the significance of Christmas. Sorry are we to notice a disposition to turn from the beautiful tradition of the past which has rendered Christmas the holiest, happiest day of all the year, especially to the children, and to substitute pagan ideas, devoid of sentiment and teachings of christian graces which have done so much to civilize and christianize the world for nearly 2000 years.

The christian world has recognized one paramount thought in Christmas—giving in the spirit of love. The Christ principle teaches this and the human mind has so thoroughly absorbed this idea that to depart from it, or to separate Christ from it, would rob it of its significance. Christmas without the association of Christ would be absurd and meaningless. The two are synonymous, interwoven and a unity.

In this day of selfish greed, the children need, just as clearly as we can teach them, well defined ideas of the value of giving for the good giving does others. They need to have this thought kept prominently before their minds and any lapse from the beauty of Christ's example in this particular will prove a mistake.

Observe, therefore, the occasion in the spirit of the ages. Give for the pleasure it will promote in the heart of the giver, and remember that in so doing you sow the seeds of righteousness which in some later day will fill your soul with heavenly benedictions. "It is more blessed to give than to receive." This is the Cultivator's message to all its readers.

A farmers' institute is announced by conductor Neff for Jan. 7, at Hollywood.

ALIENS RUSH TO EUROPE.

One incident of the financial situation which has developed in the past month, is an unparalled emigration of foreigners. It is estimated that 200,000 aliens will have cleared from New York by the middle of December. Hungarians, Russians, Poles, Slavs and Italians predominate, although a pretty strong representation of Norwegians is included in this exodus.

The question naturally arises, where will the agriculturists look for labor, if this emigration continues.

Possibly the answer comes in the almost certain fact that there will be an exodus of young men from the stores and shops and railroads to the country, if the industrial conditions shall be affected for any considerable period.

Already young men are going into the country to find employment, and while they may not be as strong and as able to do a big day's work as the foreigner, they will be more intelligent and work to better ends. So the exchange of labor may not result as embarrassingly to the farmer as he now apprehends.

One thing is possible, as a result of the situation, and that is, that young men who have gone from the ranch to the city in the hope of bettering their condition, will drift back and remain permanently on the farm. When the young man takes a sensible view of farming, as it is being developed today, he will see that the average farmer who has nothing but his practical experience and native ability to depend upon, makes as much as the average professional man, lawyer, doctor or journalist, and better than the money he makes, gains health and independence. Looking at the proposition in this light, and remembering that modern methods of farming have relieved it of its slavery, made it an honorable and lucrative profession, no wonder the young man in the city is directing his thoughts toward the free and untrammelled life of the country.

Let the unintelligent alien return to his native land, if he so desires; there are enough American boys and girls left to take care of the agricultural interests of the country in a far more intelligent manner than has been the case under the hand of the uneducated foreign laborer.

POSTAL SAVINGS BANKS.

The Postmaster-general will again call the attention of Congress to his recommendation for the establishment of postal savings banks. He does this for two reasons: First, the convenience of the banks for public use, and second, their reliability. Having gone into the subject with much care, he finds that the people in general, will have more confidence in a postal bank-system, than in National banks. He maintains that many foreign-born citizens will not entrust their money to private corporations, or to National banks. In foreign countries they were taught to have faith in the government and they bring their ideas with them. The Postmaster-general recommends the payment of interest on deposits at the rate of two or two and one-half per cent, expecting to re-deposit the money in National banks at an advanced rate of interest. The government then would simply be an endorser, though the depositor would deal with the government exclusively. The certificate of deposit would be issued by the postmaster, and when it became due would be paid by the postmaster. It is stated that a large number of foreigners at the present time buy postal money orders and hold them for a year without interest, simply in order to have a safe place for their money. It is argued that postal savings banks would in no respect interfere with banks as now organized. It is also argued that postal savings banks would encourage all classes of people to save their money and place it on deposit, where it would discharge a public service. These suggestions on the part of the Postmaster-general are worthy of thoughtful consideration. Many European countries have been successfully carrying on the postal savings bank-schemes for a number of years. Former Postmaster-generals have recommended these banks, but did not succeed in securing public attention. Now that the country is considering banking systems, the Postmaster-general's recommendation may fare better than in former years.

Shop Talk

We suggest again this week the matter of CLUBBING RATES.

There is considerable good solid money (or scrip) to be saved by you if you will take advantage of our offer to price any list you may send us. We present a few more sample clubs this week which gives an idea of what can be done. There is no reason why you cannot get your CULTIVATOR free, and even more than that if ordering several magazines.

You can just as well make known to your neighbor that you would like to order their magazines for them, and divide the profit between you as you may arrange.

Remember, though, all clubs must contain the CULTIVATOR, either as a new name or a renewal.

TURN WASTE LAND TO PROFIT.

The Cultivator has persistently urged the practicability of turning unproductive land to profit by planting eucalypts or other wood-product trees. There are millions of acres of arid lands in California which might yield a handsome profit, in a few years, if they were planted to wood-producing trees.

Secretary Wilson advocates this idea in the following note:

"Our imports of wood products are steadily increasing and will continue to increase. We paid \$26,145,716 more for them last year than in 1905. Low-priced lands planted with young trees suitable to the conditions are likely to pay. Trees grow to useful size in seventy-five years. The softer woods are fit for use in twenty-five years, and thin, gravelly, or rocky soils should be planted with trees of some kind. The National Forests of the far Northwest are very grand, and grow mostly on soils that would not yield farm crops of any kind profitably. The tree subjects rocky soils to its uses, and gets its food by disintegrating the rocks that would yield plant food on no other terms. I have seen 300,000 feet of lumber which, were the trees removed, would not pasture a sheep through any known method of management. There are such lands in many of our States that should be planted with trees."

TABLE SHOWS INCREASED VALUE.

The following table shows the government's October estimates of this year's yields of corn, wheat and oats:

	Estimated yield, 1907.	Yield, 1906.
Corn	2,500,000,000	2,963,000,000
Wheat	625,567,000	735,000,000
Oats	741,520,000	931,000,000

The approximate farm value of crops is summarized as follows:

	Farm value, 1907.	Farm value, 1906.
Corn	\$1,375,000,000	\$1,185,000,000
Wheat	531,000,000	619,000,000
Oats	333,000,000	300,000,000
Other products	1,717,000,000	1,628,000,000
Total value	\$3,956,000,000	\$3,632,000,000
Increased valuation over last year	324,000,000	

Agricultural Notes of the Pacific Coast

Northern California

Considerable new acreage of oranges will be planted in Butte county this season.

Nearly all of Sacramento valley was visited by a heavy storm on the 6th and 7th.

Milk wagon drivers at San Francisco, now start at 3 a. m., instead of 5 p. m. as formerly.

The Sacramento valley is experiencing a revival of the interest of eucalyptus planting.

Ten million pounds of dried prunes valued at \$500,000, is the estimate of the yield of Sonoma county this year.

Prune packers at Anderson are still making many Eastern shipments and, as a rule, the fruit is bringing good returns.

A large number of fine cups are to be offered by the Petaluma Poultry Association at its show being held this week.

Snow has fallen on the mountains to the east of the Sacramento valley, and almost all the entire range is now white.

One day's rain last week at Ukiah amounted to an inch and a half. This makes a total for this season of 5.71 inches.

Santa Rosa hop growers are holding meetings hoping to form a hop growers' union, which will be an aid in securing better prices.

A number of sales of hops were made in Ukiah last week at two cents per pound for the crop of '06 and six cents for the present year's crop.

Sacramento valley shipped over three million dollars worth of oranges last year, and it is reported during the coming year increase that by at least a million.

Turkey growers near Colusa frightened away coyotes from their flock by attaching tiny bells to the turkeys. The coyotes are frightened by the tinkle of the bells.

Santa Rosa reports one farmer near that city who yet has 25 acres of natural tree growth on his ranch, which he refuses to have cut for stove-wood. Long may he live.

Ukiah hop growers are forming a district hop organization which will be a part of the larger organization being formed in the Sacramento valley and coast counties.

The soil proving so well adapted to grape culture near Arbuckle, Colusa county, the extension in planting will be great, and plans are now made for the planting of a great many cuttings this coming season.

Fruit growers of the entire section of the Sacramento Valley were given a treat by the gathering at Marysville of the most prominent fruit growers of California. The State convention was a great success.

The gathering of beets in the neighborhood of Woodland was continued until the first of this month. It is said to have been one of the best seasons in that section. The output from here amounted to 200 carloads.

An orchard of Franquette walnuts at Santa Rosa has proved very profitable this season. This is the oldest orchard of that variety of nut in this state, being ten years old. Mr. J. F. Burgess is the manager of the orchard.

Central California

A farmers' institute is being held in Ceres this week.

Lindsay has shipped nearly 700 cars of oranges up to this time.

The beet slicing campaign of the Salinas sugar factory closed last Saturday.

Spraying of orchards about Hanford for the peach blight is now in full swing.

The Modesto Canning Co. have filed articles of incorporation. The capitalization is \$15,000.

Property owners along the Pajaro river are endeavoring to preserve their land from overflow.

Wasco has been experimenting in sugar beets during the last season, and have found good returns.

The result of the recent effort to take part of Fresno county and add to Kings county failed to carry by 55 votes.

A shower last week over part of the San Joaquin Valley brought much comfort and did some little good to pastures.

Lemon Cove won the first premium for best display of citrus fruit at the recent fair from any one locality in Tulare Co.

The Stanislaus Industrial Exhibition have already fixed upon the date of the next Fall exhibit, which will be in September, 1908.

The Armsby Packing Company at Hanford is paying for fruit in time checks, which will be paid in cash as soon as returns arrive from the East.

A meeting has been called at Lindsay to form a permanent Orange Growers' Organization. It is hoped that the organization will extend all over Tulare County.

Farmers along the west side near Crows Landing are anxiously inquiring "Where is Hatfield?" His contract to furnish scads of rain after November 15th doesn't seem to materialize.

A meeting of representative orange men of Lindsay was held in that city last week to consider the advisability of organizing the citrus growers, and a motion to the effect that such an organization should be perfected was carried unanimously. A committee of seven was appointed to outline a plan of organization.

The following are the officers of the Tulare Grange for the coming year: W. M., J. T. Lawson; overseer, C. A. Henry; lecturer, John Tuohy; steward, F. H. Styles; assistant steward, A. J. Woods; chaplain, Mrs. A. Fay; treasurer, Mr. Watts; secretary, Mrs. B. I. Morris; gate keeper, H. Hunsaker; Ceres, Mrs. Lowman; Pomona, Mrs. Way; Flora, Mrs. Griffith; L. A. S., Mrs. J. T. Lawson; organist, Mrs. F. H. Styles.

The San Jose Grange recently elected officers as follows: Master, Robert Summers; overseer, L. J. Church; lecturer, Mrs. L. J. Watkins; steward, D. Satterthwaite; assistant steward, E. L. Roberts; chaplain, Mrs. A. Hulet; treasurer, Cyrus Jones; secretary, Mrs. Carrie C. Morris; gate keeper, Hugh Leigh; Ceres, Mrs. Sylvia Abbott; Pomona, Mrs. Hugh Leigh; Flora, Mrs. L. J. Church; lady assistant steward, Miss Alice Phelps; organist, Mrs. A. E. Winans; executive committee, E. T. Pettit.

Southern California

The peanut crop of Orange Co. is practically all harvested.

The Tustin Packing Co. ships about five cars of celery per week.

Celery has greatly improved in quality during the last two weeks.

Coachella is beginning to plan harvesting of onions for the Christmas trade.

Riverside is making a pull for the spring meeting of the State Fruit Growers' Convention.

Anaheim shipped 21 cars of walnuts this season, which is greater than its last year's output.

A company is to be organized to engage in "Thornless Cactus" farming on the Colorado desert.

Ventura county beet growers find best results by rotating beans or some other crops with the beets.

From fifty to 150 cars of oranges were forwarded weekly from Redlands during the shipping of holiday fruit.

The box famine or rather the fear of a box famine is causing much uneasiness on the part of citrus fruit shippers.

El Modena and Villa Park are acquiring quite a reputation for their winter vegetables as they are located in an almost frostless section.

The yield of peanuts of the San Joaquin ranch in Orange county for this season was about 9000 sacks, averaging about 45 pounds per sack.

Nearly 3000 acres of sugar beets have already been planted in Ventura county. Over 10,000 acres have been contracted by the Oxnard factory.

Ed Utt's chili dryer which was destroyed by fire a few weeks ago, has been replaced and is now filled with chili for next season's shipments.

Almost every farmer who had beans out in the October storm has been compelled to clean, or rather sort, his beans from those which were discolored by the storm.

Most orange packing houses in Southern California have closed until the January pack begins. The output of holiday fruit was the largest in the history of the industry.

Pasadena is planning for a tournament of roses on New Year's day. This day into which the Rose is made the queen of the carnival has become a great feature with Pasadena people.

The recent Farmers' Institute held at Brawley was well attended, and a good program rendered, though some Imperial Valley people maintain that it was hardly up to the last institute held there in being beneficial for giving information as to agriculture under local conditions.

A peculiar trouble has been visited upon the Chinamen and others employed to clean beans, a portion of which were spoiled by the October storms. The beans are cleaned by passing in front of the workers over a kind of screen which is kept in constant motion to pass the beans along. It is claimed this constant motion of the machine and the passing of the beans before the eyes has made some people so seasick that they had to throw up their job.

The Coast

Hemet farmers are rejoicing in rural free delivery.

Oregon prunes are beginning to move forward more rapidly.

The cost of inspecting Oregon sheep last year amounted to over \$4000.

Colorado claims to be one of the best of States for the production of corn and wheat.

Whitman County, Washington, will ship a total of ten times as many apples as last year.

The Verde valley show of agricultural products proved to be one of the finest displays ever made in Arizona.

The total number of sheep in Oregon at this time is 2,316,997; of these about 300,000 have been dipped for scab.

The Newberg, Oregon, meat packing company is said to be turning out a fine pack of cured meat this season.

The sheep industry of Utah is said to be in much better condition owing to a well managed campaign against the sheep scab.

One of the leading industries of the Salt River Valley is the production of olive oil. A large mill is giving extensive output this season.

The Willamette apple show held in Portland, Oregon, recently is commanding many commendatory comments from the press of that State.

The boll weevil, which has been so disastrous to Texas cotton growers, is marching eastward, and is now said to have crossed the Mississippi.

Texas railroad commission has instructed the more prominent roads of that state to buy more locomotives and cars for handling farm products.

The large number of apples stacked in the warehouses at Pullman, Washington, are being shipped out in refrigerator cars after a long period of waiting for shipping facilities.

The Director of the Idaho Experiment Station announces a short course in dairying and horticulture at the University of Idaho. It will begin Jan. 22 and run until Feb. 8.

The ninth annual fair of the San Antonio International Fair Association was held at San Antonio last month. The exhibition of Angora goats was said to be very fine.

Emery, Utah, which has been one of the heaviest shippers of alfalfa seed in the past, will have a far less output this year than for many years. Seed is now selling for 10 to 12 cents per pound.

The bank of Seattle, Washington, is planning to secure funds for moving the great grain output of that section. This movement has been held up by the shortage of currency for some weeks.

Farmers' schools will be held in Utah as follows: Kamas, this week, Mount Pleasant Dec. 16th, Pleasant View, Dec. 30th. These schools are similar to the Institutes of California, only more extensive.

Wheat shipments from Washington, which have been delayed so long by the car shortage, will now go forward much more rapidly. The cars have been secured by the action of the State railroad commission.

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's Caustic Balsam

IT HAS NO EQUAL

For — It is penetrating, soothing and healing, and for all Old Sores, Bruises or Wounds, Felons, Exterior Cancers, Boils, Corns and Bunions. **Human CAUSTIC BALSAM** has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

Perfectly Safe and Reliable Remedy for

The Cream of Cream Separators

The Sharples Dairy Tubular is the cream of cream separators—the pick of the whole bunch. Simply can wait low, you can fill it with one hand. All gears enclosed, dirt free, absolutely self-oiling—no oil holes, no bother—needs only a spoonful of oil once or twice a week—uses same oil over and over. Has twice the skimming force of any other separator—skims twice as clean. Holds world's record for clean skimming.

Bowl so simple you can wash it in 3 minutes—much lighter than others—easier handled. Bowl hung from a single frictionless ball bearing—runs so light you can sit while turning. Only one Tubular—the Sharples. It's modern. Others are old style. Every exclusive Tubular feature an advantage to you and fully patented. Every Tubular thoroughly tested in factory and sold under unlimited guaranty. Write immediately for catalog J-260 and ask for free copy of our valuable book, "Business Dairying."

THE BABCOCK TEST.

THERE are several forms of sample holding bottles with glass stoppers. These are good but more expensive than necessary for the ordinary dairyman. I use the half pint cream bottles with snap tops. If these are kept in a dry place the tin caps will not rust. Rusting of caps is the fault complained of by some people that do not like the capped jar. The milk bottles with paper tops will not permit of a vigorous shaking up of the milk when the new samples are added. An open-mouthed bottle is objectionable on account of the dust falling into it; this may obscure the reading of the fat column with charred particles. A greater cause for errors in calculation is in having the cream to clot and dry by evaporation. As the tests deal with minute quantities at best, a little clotted cream put into the test bottle will increase the per cent of fat considerably. Putting the clot to one side will not answer, for then the milk is unduly impoverished.

The cream clots are best dissolved by carefully measuring the same amount of warm water that there is of milk, adding it to the jar and shaking until the clots are dissolved. In reading, double the amount of fat shown in the column. Curds are troublesome, also a tiny speck of concentrated lye will cut these readily. Be careful, for sometimes the acid will fly out of the test bottle when lye has been added to the milk. The lye is an extreme resort in these cases. The samples should be carefully enough cared for and enough preservatives added to prevent the curds from forming.

Taking the Samples.

The samples are taken from the milk pail after the milk has been weighed, not before. We use a milk "thief;" this is a long copper tube with a self-closing end, made for sampling wines. When it is put carefully into the milk pail it takes a sample straight up and down from the top to the bottom of the pail. While these copper tubes last a life time, the only thing that happens to them is that they travel with ease to the junk shop. They have to be kept under lock and key. The conical dipper made of granite ware lasts well and is of no value to sell. It does not matter how a sample is taken, only that it represents the average of the milk. The usual way of stirring the milk is to pour it from pail to pail until thoroughly mixed together. There is always more milk in the sample taken than is needed in testing. It is a more accurate test if an exact amount of milk is taken from each milking. The milk sample is poured from the dipper into a measuring glass, then from the glass exactly half an ounce is poured into sample bottle. Shake the sample bottle up to mix in the added milk. Half an ounce of milk from three days milking will give a sample of six half ounces or three whole ounces. This is enough for testing and allows liberally for spilling.

Preservatives.

The bichloride of mercury or corrosive sublimate tablets are convenient to use.

The bichromate of potassium comes in powdered form and is equally good as a preservative. It colors the milk a Chinese yellow, hideous enough to scare away any appetite for that milk. The corrosive sublimate tablets do not affect the color of the milk. There are two experiences firmly engraved on my mind that happened on the ranch as to the possibility of accidents from the use of a colorless preservative. One day a tramp came into the barn, picked up one of the jars, the head milker had time to knock from his hand the jar just as he raised it to swallow the milk. The tramp thought the milker struck at him, instead of at the bottle; a general mix-up ensued. The milker had a black eye and the tramp a bloody nose when peace was made and the matter explained. Then the tramp went to town and saw a shyster who wished to sue for damages for having poisoned milk around handy for tramps.

A Cat Story.

The other story I think I have told before. It was of a cat, a pussy that was a mighty hunter of gophers. She was wise, making friends with the cows. Out in the fields she would go with the herd. It was not uncommon to see her sitting on a cow that was lying down. She would wash her face and then curl up for a nap on her friend's broad back. No strange dogs dared molest her while she was among the herd. At milking time pussy would stand close to Angelo's side. She dearly loved warm milk. "Yow" said pussy, "ready" was Angelo's response; at the word a well aimed squirt of milk would go into pussy's wide-opened mouth. This would continue until pussy had a full meal. Angelo saw a bottle of milk standing on a low shelf and slyly poured it out for pussy. I had written on the jar "poison" in as large black letters as possible. As neither of them could read English this did no good. Pussy passed away. She is still a tradition at the barn, handed from milker to milker; the stories of her wonderful intelligence increase like all traditions as the years roll on.

Time of Testing.

Many dairymen starting to test cows that are being bred up to breeding form, think to do so every month is too laborious. It does take time, but by and by it grows very interesting, better than a "dime novel" the milkers often say. By tabulating the tests of a thousand cows it was found that a carefully made test at certain periods had a definite relation to the amount of milk a cow would give during the year. The cows should be tested six weeks after freshening and again at four months and a half, then again at seven and half months. The actual number of days in milking are then counted. The year is considered as many days as the cow gave milk. For the first couple of years with a grade herd this answers very well. But I would be willing to say the work of testing adds to the interest in the cows, that it is soon no hardship to do it monthly. The testing brings out many little things, slight irregularities in butter fat and milk flow, and starts the owner to

DR. HESS STOCK FOOD

Animal growth and milk production are dependent for full development upon a healthy digestion. The key to the feeder's problem then, is a suitable tonic to prevent derangement of the digestive organs. Dr. Hess Stock Food is such a tonic. By making the greatest proportion of food digestible, it keeps the animal in health, causes rapid growth and a full measure of production.

Professors Quittman, Winslow and Finley Dun endorse the ingredients in Dr. Hess Stock Food. It is the prescription of Dr. Hess (M. D., D. V. S.) and is sold on a written guarantee.

100 lbs. \$7.00 25 lb. pail \$2.00
Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal compound, and this paper is back of the guarantee.

If your dealer cannot supply you we will.

Investigating. Little leaks that are eating into the profits are found at every hand. It will keep you figuring with pencil to feed as cheaply as possible. When, at last, you do arrive at an understanding of the cows, it becomes an absorbing study.

The Best Cow.

One may follow cow judging and think they know all about the cows, but they will never know how little they really do know about a cow until they follow her milk tests as a producer over a term of years. I am willing to propose this test to any one who has an untested herd. Pick out the ten best cows and the ten ten poorest cows of the herd. Then select from the ten best the first, second and third best. From the poorest the first, second and third worst. Put it into writing. Have as many more of your friends do likewise as you can find. Then test one year. I would be willing to wager that you will not have chosen the best cow for number one or the worst cow for the end of the list. I have known instances where the three best cows of the herd were not in the first ten chosen, nor were the poorest in the last ten. The reason lies in this—that the steady cow that makes no spurts, is the cow that continues to the end and makes the money. It is the drop by drop that fills the milk pail day after day that counts.—M. E. Sherman.

DO SHEEP INCREASE FERTILITY?

A correspondent from Inyo county writes: "In your judgment will sheep increase the fertility of land?"

This question was referred to a sheep grower of many years' experience, and he makes this answer:

"Sheep are great renovators of wornout farms and conserve fertility. They not only conserve fertility, but they distribute it if so allowed. As cleaners of land they are fine. I once turned some sheep into an alfalfa field; they at once sought out the spots where the alfalfa did not catch and eagerly devoured any weeds or grass that had taken possession of the spaces. They then sought the weeds and succulent grass in the low places and runs in the fields, leaving the grass on the high land, where most needed to enrich the soil, untouched, only touching this grass when practically everything else had been eaten.

"More than this, when night came the sheep sought the higher portions of the field for their resting place and their droppings there deposited the fertility gathered during the day from the lower land, thus conveying back what had been washed away through the process of nature and cultivation. A farm upon which sheep are kept ought to be not only fertile, but also evenly fertile, which is a much desired condition. Farms are very few which cannot with profit keep sheep."

Butter can be more thoroughly washed free from buttermilk while in the granular condition than after it is gathered or pressed into a roll.

Rapid milking is an advantage if it is done without hurting or irritating the cow and she is milked clean.

The best plan is to maintain the milk flow as uniformly as possible while it continues.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Climax Ensilage Cutters

In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in a much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength and durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half-inch lengths, other feed in proportion. For further particulars, call on or address

The Ornamental Garden

IDEAL POTTING MATERIAL.

HERE is the method employed in the manipulation of the leaves by a large greenhouse whose potted plants speak eloquently of the value of the leaf mold, which has been used in their growth:

After the leaves have fallen in autumn they are raked up with common hand rakes and loaded into push carts that have had a light framework added to the top, lined with cotton cloth. A man with a rake and one of these cars can gather an enormous heap of leaves in a day. A similar square frame, lined with cloth, could as readily be fitted to a common wheelbarrow if a push cart is not at hand.

Put into Bins.

The leaves being light and dry, cannot now be placed in the piles in which they are to be converted into leaf mold, but must be put into great bins out of doors and left to become sodden with rain during the winter, in which condition they can be handled with manure forks. These bins can be made of fencing a little plat of ground, twelve or fifteen feet square, with old boards or with wire poultry netting. Drive stakes at the corners, with two or three along the sides, and nail the boards to these, leaving open spaces of three or four inches between the boards, or stretch the netting from post to post and staple it well.

To Facilitate Rotting.

During the following spring and summer the leaves should be turned over occasionally, as exposure to the air will facilitate rotting. In the fall put the half rotted leaves into a square, compact pile and allow them to remain here over the second winter. During the following season they will be found to be reduced to a fine, crumbly condition, which makes ideal potting material and is exceedingly useful for spading into the flower or vegetable garden out of doors.

In the meantime, of course, another year's autumn leaves have been raked up and carried to the bins, where they in turn will become thoroughly wet and compact by the rains and snows of winter. Thus every year there is at hand a supply of the most valuable material that can be obtained by the gardener, and that, too, at very small cost.

IXIAS GIVE TELLING COLOR.

For bright and telling color there are few bulbous plants to compare with ixias. In the southern and western States they may be grown with ease. In warm latitudes they may be kept out of the ground as late as December, and when planting a little sand or road grit should be placed around the bulbs. They like a sound, well cultivated rather than a very rich soil and one of such comparatively light nature that the roots run through it freely. In borders close to the house where the young growth is protected from the chilling winds in spring they succeed and have a very fine appearance.

If grown in pots in the green house they may be potted at various times to obtain a succession of bloom, but must not be forced or hurried along in heat. Any one who has grown *Gladious*, the *Bride* under glass may take up ixias with every prospect of success. Place five to eight bulbs in

four-inch to six-inch pots in a compost consisting of light loam, leaf mold and a little well decayed manure. Give one watering to settle the soil and then place the pots under a bench or in a cool shed, covering them with ashes. This will encourage root action, which it is necessary to do before the tops begin to grow. When growth commences take them to the greenhouse and bring them on steadily until the flowering stage. Then gradually dry them off at the root, and when the foliage has quite died down store the bulbs in a cool, dry place until again needed, or they may be left in the pots and kept dry if this is more convenient.

NOT ALWAYS NURSERYMEN'S FAULT.

It is with much pleasure and profit that I read your valuable paper. The article in the number of Nov. 21st, entitled "Pedigreed Nursery Stock," attracts my attention at this time, for the reason that of late I have heard a great deal about nursery stock not being true to name. While this article is of interest and is logical, it is also worthy of consideration. But still, it casts an undue reflection on the nurseryman.

I have had considerable experience in the nursery work and am acquainted with its difficulties. The fault does not all lie at their door, for so often that a nurseryman takes all the precaution that he can and sends out trees that are absolutely true to name. The trees are planted, by just as unexperienced labor as the nurseryman had, and cultivated with same kind of hands. Trees let go until pruning time comes around; the same kind of men go out to prune. By this time the trees have grown over the scar caused by the graft or bud and in many cases there sprouts that have come up below the graft or bud, on account of its being direct from the main stock it takes more sap and becomes much larger than the graft and in many cases the graft or bud dies, the tree is cut off, the seedling sprout saved and brought up to bearing. The result is a seedling, and in some cases it so resembles the variety wanted that the owner never knows what has taken place, and in other cases the tree is a worthless seedling and the nurseryman gets the blame that is not due him.

This all happens many times, yes, very many times, that I know of. It happened with me many times and I know of very peculiar examples.

One of the most peculiar instances, was in a lot of Muir trees. When they came into bearing there was a Lovell, but it was not a Lovell for it ripens 10 days later and there was not a Lovell tree in the block of Muirs, which the scions were taken to bud the Muirs, neither was there a Lovell budded in the nursery or was there one on the place. I could give you dozens of such cases, but time forbids.—A Grower, Dinuba.

THE COMPOST HEAP.

Compost anything and everything, including your barn manures, your anthracite coal ashes, your autumn leaves, all your old refuse stuff, and plow under your legumes. The man who burns up his annual crop of leaves and waste stuff and then is compelled to spend his good money in buying fertilizer is not wise.

FERRY'S SEEDS

The Fruit Growers' Convention

THE Thirty-third Fruit Growers' Convention, which was held at Marysville this year, while not so numerously attended as most of the recent conventions have been, was nevertheless one of the most interesting and instructive that has ever been held. Interest in the proceedings was maintained from the beginning to the end, and at the close there was still a very good audience present.

The papers and addresses, taken as a whole, were the best ever presented at a convention of fruit growers in our state and very many attractive features were introduced. The opening address was made by Governor Gillett, who made a very happy and well turned speech congratulating the fruit growers and assuring them of his hearty sympathy with them in their great productive industry and giving them the assurance that, while he is the governor, the influence of the administration will be used to forward their work by all legitimate means.

J. W. Jeffrey, the new Horticultural Commissioner, made his debut as chairman of the convention. His address was well received by the audience and carried with it conviction that he was a man who would do his duty in the responsible position to which he had been appointed. It was a well prepared address, abounding in good points, and breathed a spirit of fairness and civic pride which made friends of all present. There has been an idea abroad in Northern California that Mr. Jeffrey would be a Horticultural Commissioner from Southern California, but after hearing this address, it was quite evident that he is a Horticultural Commissioner in California. He is very broad—broad enough to comprehend the entire State and to understand its diverse requirements.

Space prevents even a mention of the many good papers which were read and the instructive debates which followed, but something must be said of three features especially and one of these was the address of M. O. Lownsdale of La Fayette, Oregon, on the Apple in the Willamette Valley. Mr. Lownsdale is the largest apple grower in the whole Pacific slope, and he fully appreciates his work and loves the apple. His address was a poem in its phraseology and its rendition, as he pictured the beauties and glories of his favorite fruit. He is an eloquent speaker, and his audience listened spell-bound during the rendition of his address and applauded to the close of its conclusion.

The next was the address of John P. Irish on the labor question. Mr. Irish is too well known in our state to require an introduction to our readers. He is one of the most eloquent orators in California, and always talks as he believes. He is convincing, for this reason, and usually carries all with him. On the present occasion he touched upon a matter upon which the fruit growers of our State, in common with all other agriculturalists, are in deep sympathy, the necessity of securing some form of available labor to harvest their crops. He showed that the labor unions of the city dominate the whole country, and that by this domination and their reckless disregard for the rights of others, they are crippling

the agricultural industries of our state. That there are certain forms of work which white men cannot or will not do, and for these we must have other classes of labor, that this labor, so far from competing with white labor, is an adjunct to it and opens new channels for it. He illustrated this by the difficulty of getting labor to thin beets in the field, and showed how white men would do the plowing and the sowing and cultivating, labor which could be done with machines and horses, then when the beets were delivered at the factory white labor again would take them and do the necessary work of manufacturing, but when it came to the stooping over day after day, in the hot sun, thinning the plants, the white man rebelled and either some other form of labor must be had or the crop be lost; so it was absolutely necessary that some form of labor must be had to step in between the time of planting and the time of manufacturing, or the men who were engaged at both ends would have no employment and, therefore, such labor was an aid instead of a menace to white labor. He made other illustrations of a like nature and concluded by presenting a memorial to congress to repeal the Chinese restriction act. This memorial was adopted by the convention en masse without a dissenting vote.

The third great address of the convention was that of James Mills of Riverside, on the Value of Cover Crops in Preserving the Life of the Soil. Mr. Mills is a brilliant talker, and he has a thorough mastery of his subject. The title would indicate a dry topic, but the hall was filled to hear it and from the beginning to the end the speaker held his audience. His address abounded with valuable facts, all of which were of direct interest to every person present, as showing the absolute necessity of feeding the soil, if we would continue to have crops, and the superiority of some cover crop, preferably one of the legumes, for this purpose. Mr. Mills' address was at once eloquent and convincing and he held his audience until late in the evening and then answered a rapid fire of questions, all of which indicated that he had been listened to understandingly.

An address by Prof. M. B. Waite of Washington, on California Orchard Diseases, was another subject of marked importance. Prof. Waite dealt principally with the pear and the peach blight, both matters of vital interest in the section in which the convention was held. His address was clear and instructive, and at its conclusion he was required to reply to numerous questions which he answered with great clearness.

Paul Shoup, of the Southern Pacific Railroad, gave a very interesting address in which he touched upon the Common Interests of the Fruit Growers and the Railroads, and explained how it was to the direct interest of the roads to give the best service in their power, and that this had always been done. It was true that transportation was not perfect, but new conditions are constantly arising, which present difficulties to the roads, and these are not often regarded by the shipper who desires perfect service for himself. Mr. Shoup

Deciduous Fruit Culture

COMBINED INSECTICIDES FOR
PLANT LICE AND THE CODLING
MOTH.

ON ACCOUNT of the abundance of the green aphid and the woolly aphid in many fruit growing sections, it is evident that it would be a matter of economy to be able to apply together insecticides that would destroy both the plant lice and the codling moth or apple worm.

Years ago certain entomologists, recognizing the advantage of such a spray, advised the combining of kerosene emulsion and a spray of Paris green or London purple wherever it was found necessary to destroy both leaf feeding insects and plant lice at the same time. I tried the combination of these insecticides until I became thoroughly satisfied that it is not practical to use arsenical poisons with a kerosene emulsion.

The oil in the kerosene emulsion is broken into extremely minute globules causing it to be suspended in water, and every solid body, as the fine particles of Paris green or London purple, serves as a nucleus about which the little globules collect and then rise to the surface, which soon results in the separation of the oil from the mixture.

There are combined insecticides, however, that can be used with success, and probably there is none better than a spray composed of arsenate of lead and either tobacco decoction or a strong, soapy mixture.

The orchardists upon the Western Slope in Colorado have thoroughly demonstrated that a tobacco preparation known as Black Leaf Dip, used in water in the proportion of about one gallon of the dip to 65 or 70 gallons of water, is a very effectual remedy against the plant lice of the orchard when thorough application is made. It has also been thoroughly proven that arsenate of lead is one of the best, if not the best, arsenical poisons for the destruction of codling moth. As the tobacco preparation is not an emulsion and as it does not combine in any way with the arsenate of lead or act as an antidote to this poison, these two insecticides may be used together. In so doing it would be necessary to use each poison strong enough to kill the insects for which it is applied. By this I mean that the Black Leaf Dip should be in the proportion of about one gallon to 70 gallons of the mixture, and the arsenate of lead should be in the proportion of about one pound to 20 gallons of the entire mixture. As the arsenate of lead has no power to destroy plant lice, neither has the tobacco preparation any appreciable effect in destroying the codling moth larvae.

If winter or early spring applications have been made in the orchard for the destruction of the plant lice, and if these applications have been successful, it will not be necessary to add the tobacco preparation at the time of the first treatment of the orchard for the codling moth. In fact, it is probable that it would not be necessary to make the combined spray mixture before the first of June, or at the first spraying after the plant lice are noticed to be present upon the trees. On the other hand, if the winter or early spring sprayings have not been attended to, the combined spray could well be

used at the time for the first colding moth treatment, or when the petals have mostly fallen from the apple trees.

In case one prefers to use one of the whale-oil or tree-soaps in place of tobacco, they may be employed without any deleterious effect upon the arsenical poison, and neither will the arsenical have and bad effect upon the spray in its work of destroying the plant lice. Most soaps used for the destruction of plant lice may be used in the proportion of one pound to eight gallons of water. Then, in case soap is used, a 200-gallon tank should have about ten pounds of arsenate of lead and twenty-five pounds of soap for the combined spray mixture.

It will not do to depend upon using a combined spray at all times, because it will often be necessary to make an application for the codling moth when it is not necessary to make treatment for the lice. And it will also be necessary occasionally to make application for the destruction of the lice when it would be useless to add the arsenical poison.—C. P. Gillett of Colorado College.

A MAGNIFICENT LUMBER TREE.

On these pages appear engravings of The Royal Black walnut in full foliage and dormant. These engravings are from a catalogue of new products, which are now being handled by the Fancher Creek Nursery of Fresno. They are the result of the experimental work of Luther Burbank at his Santa Rosa experiment grounds. Mr. Roeding, of the Fancher Creek Nurseries, will handle a number of the Burbank productions this year, and to bring them before the public, he has issued an exceedingly beautiful booklet of 30 pages. It is not only filled with the half tone engravings similar to the ones on this page, but has a number of colored plates, which are works of art. This treatise, for it is such rather than a catalogue, will be mailed to anyone for much less than its actual cost. A price of ten cents has been put upon it, and anyone who wishes to see some beautiful color plate work, of some of the later Burbank plums, and of the finished lumber of the Paradox and Royal Black walnut, and at the same time see artistic printing, can well afford to send a ten-cent silver piece and ask for this booklet. It has excellent portraits of Mr. Roeding and of Luther Burbank besides its many other valuable features. Regarding the Royal, of which we give the photograph, the booklet says:

"The feasibility of growing the Black walnut for timber purposes has often been urged on land owners and foresters. The principal obstacle has been the rather slow growth of the tree, it requiring something more than twenty years to produce sawable logs. These conditions excited the mind of Mr. Burbank to the feasibility of hybridizing the Black walnut (*Juglans nigra*) of the Mississippi valley with the California variety (*J. Californica*) with the hope that the hybrid would produce a wood of fine quality and a tree which for rapidity of growth would produce merchantable timber in half the time required by the Black walnut,—a feat possible only by the patience, care, minute observation and "know how" of a Burbank. Hybridization in the

Sixteen-Year-Old
In

wild state happens at very rare intervals, hence we believe that the Royal is the first case on record of its having been accomplished artificially.

"The Royal makes such an unequaled growth that it will be best to plant the trees for timber growing about fifteen feet apart each way and when six to ten years of age half of the trees should be removed to give the remainder room. Cultivation during the first few years is of great advantage. Any ordinary crop can be grown among the trees until they claim the whole space."

THE FRUIT GROWERS' CONVENTION.

Continued from Page 603

assured the convention that his company was in hearty sympathy with them and rehearsed the many improvements which had been made by it in the transportation of fruit, and that it would continue to do all in its power to forward the great industry there represented. The address was in all respects conciliatory and won with the audience which, at its conclusion, heartily applauded the speaker.

During the convention week, the County Horticultural Commissioners held two separate business sessions, at which matters of direct importance to their labors were considered. There was also an Entomological session at which insect pests and diseases, and the various means of holding them under control, were considered.

These are but a few of the more important subjects dealt with, but there were many more, and every session was replete with excellent papers which evoked discussion and, taken together, the convention was one of the most instructive ever held.

On the theory that, "All work and no play makes Jack a dull boy," the Committee of Arrangements prepared a reception for the attendants on Tuesday evening. This was gotten up by the Ladies' Civic Improvement Club of Marysville and the Women's Improvement Club of Yuba City. There was a large gathering of the people of both cities to welcome the fruit growers, and the evening was spent in friendly association. An excellent musical programme was presented and a most enjoyable banquet had been prepared. On Thursday an excursion over the electric lines to Oroville and Chico was given and nearly all the visiting members took advantage of it to visit these towns.

Upon adjournment those present gave a hearty vote of thanks to all who had been interested in making their visit an enjoyable, as it had been a profitable one, and the consensus of opinion among the members was that the Thirty-third Fruit Growers' Convention had been one of the most successful and best conducted, one of the most instructive and altogether one of the most enjoyable, ever held in California.

GRAPE CUTTING HINT.

Commissioner Pease of San Bernardino county says: "We have an authority here who says that contrary to old established rules that if in grape cuttings you will take two buds of the old wood each time you will get far better results."

C. F. Hiel left Los Angeles last week on the special celery train with notebook and thermometer, to follow the train to its destination in the eastern market. He hopes to secure information which will be of value during the remainder of the shipping season.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:

POULTRY EXPERIMENTAL WORK AT STATE EXPENSE.

TOO much cannot be said of the great good that is being done by our State experiment stations to help the farmer to solve problems of the farm, problems that can be gotten at in no other way. This is especially true in the poultry industry. Do we as poultrymen and farmers get the benefit of the six millions of dollars that is being spent annually by the government and the State experiment stations for this experimental work? If you, reader, are not, you had better start now, for you are throwing away your share of the six millions, of which the farmer pays but one-third.

Experimental work, like inventing, is different from manufacturing, because the occasional great achievements must pay for the many trials that are not productive. Secretary Hays tells us, however, that it is not too much to claim that each dollar invested in this line of work increases agricultural production from \$10 to \$100.

Great strides have been made along this line in the last twenty-five years, and this is especially true of the poultry experimental work. It has only been about fifteen years since the first bulletin was published pertaining to poultry. This bulletin was published by the Rhode Island Station, the subject being Capons; the paper, however, was more on instruction than on experiment work. It was not long after this that several stations took up the poultry work, until today there is in nearly every State in the Union a poultry experiment department.

Every poultryman and farmer in the State should have his name on the mailing list of his State experiment station; by so doing he will receive free bulletins published by the station. He may also have his name entered on the mailing list of the Department of Agriculture at Washington; this will enable him to receive monthly a list of bulletins published by the department, from which he may pick out those of interest to him.

Do we need this State work in California? Let us look at statistics for a moment, and we find that in California there is being used annually about nine million dollars worth of poultry products. Of this amount there is produced in the State but six million, the remaining three being paid out to farmers and poultrymen of other States. This should not be so, for with our un-

surpassed climate and favorable conditions we should not only be raising all we use at home, but should be exporting to other States and countries.

Why let our Eastern brothers get ahead of us in this branch of experimental work? In a number of the Eastern agricultural colleges we find that poultry culture has been placed on the same ground and is given as much credit as other branches of agriculture. At a great many of the Eastern experimental stations as much, and in some cases more, money, is being expended for poultry investigating than on other lines of work.

The State of Maine is a good example of how a State can be benefited by this kind of work. Maine was one of the first States to take up poultry investigation, and I think that I am right when I state there is more and better poultry being raised per capita in the State of Maine than in any other State in the Union.

I am sure that there is not a poultryman in the State who will not agree with me when I say we should all work together for the upbuilding of this great industry in our own State. If we as a State can pay out annually three million dollars to the farmers of other States for poultry products, we surely can afford to increase the present appropriation of two thousand dollars, which our poultry Experiment Station at Petaluma is now receiving.

The California Poultry Experiment Station has done very good work in helping the poultrymen of the State to solve their problems, but it should be doing more. It is up to the poultrymen of our State to build up this great work, for I am sure that we now have enough people in our State interested in the poultry business who, if they get together, could have whatever they wish from the State for this line of work.

Let us get together. We want a poultry association in every county in the State, associations that will hold a good live meeting at least once a month, where subjects and problems that have come up during the month in the members' own yards can be talked over, and I venture to say that if the associations so wished they could have for the asking a State worker attend their meetings to talk on State work. Alfred G. Lunn.

A synopsis of State experimental work will be given next week.

MARKING POULTRY.

For any poultry keeper who makes even the least pretensions of being systematic, it is absolutely necessary to keep the ages and the blood of his birds. Sometimes we keep hens over for a second year, and it is not always easy to tell which is a one and which a two-year-old. Poultry fanciers use rings usually made of strips of aluminum and being numbered consecutively. If we have only a few birds to keep over, or desire to mark a few roosters for identification, these rings will do very well. With a large number of fowls to mark, as for instance, when we have different lots of the same breed, obtained from different breeders, or in order to simply

LILLY'S BEST SCRATCH FOOD

A perfectly balanced mixed grain feed strengthened with beef scraps, granulated bone, charcoal, grit and shell. It is rich in all the elements necessary to make hens lay and feathers grow. Practical poultrymen praise it highly.

"My chicks never laid more eggs than when I fed them Lilly's Best Scratch Food." J. F. JURGENSEN, San Jose, Cal.

"I never had such a wholesale production of eggs as I have since feeding your Scratch Food." J. W. DAKON, Burlington, Wn.

"I am getting more than one-third more eggs since using your Scratch Food." F. A. SMITH, Sedro-Woolley, Wn.

"My hens are laying lots more eggs since using Lilly's Best Scratch Food." L. FERRIS, Everett, Wn.

When writing advertisers, mention Cultivator

mark a flock to keep track of their ages, we prefer to use a common poultry marker or punch, such as can be bought for 25 cents, and then punch one or more holes into the webs between the toes. This operation does not cause the bird any particular pain or inconvenience, but the mark will show ever after. Another method which we have practiced for many years, and which is extremely simple and has always given satisfaction, is the clipping off of the end of one of the toes. Our practice always has been to clip just the end of the outer toe of the right foot of any cockerel just after the operation of caponizing has been successfully performed and before it leaves the operating table. This treatment seems more cruel than it really is. It causes the bird little pain or inconvenience, and we always know our own capons afterwards by the missing end of that toe. Of course, a bird marked in this simple and perhaps crude manner would be disqualified as an exhibition bird, while toe "punches" of the regular poultry marker would not thus disqualify a bird. But one mark or the other it must be if we desire to avoid getting "mixed up" on ages and strains.—Practical Farmer.

WHY HAVE LATE-HATCHED PULLETS.

One of our exchanges gives the following advice as to late-hatched pullets:

"These late hatched pullets properly cared for will seldom lay until the following March after molting, but will be found to earn as much in their second year as in their pullet year. One cannot afford to kill a female until fully two years old."

That is all right so far as it goes, but we wish our esteemed contemporary had added the advice to not have late-hatched pullets if it is possible to get early-hatched ones or good yearling hens. Upon his own showing the late-hatched pullets seldom lay until the following March, after molting, and everyone knows that in March and after is the veriest low water mark in the price of eggs. Those late-hatched pullets have had to be fed and housed all winter, and there is a big hunk of "dead horse" to be gotten out of the way before there is any profit from their eggs.

The point is that house-room and food has to be provided for several months after the early-hatched birds have paid for themselves and are earning fat dividends, and if one has other birds to occupy the houses it is the greatest folly to keep the late-hatched pullets; if the houses would stand idle unless occupied by the late pullets there is justification for keeping them, but if there is a stock of good year olds to occupy them we strongly advise that they be kept over and the late pullets sent to market. The year-olds will lay as many eggs as the late pullets, the eggs will be larger and better for hatching in the spring, and the chicks hatched from the eggs of year-olds will be stronger and more vigorous.

It is certainly poor policy to keep a lot of late-hatched pullets if there is any other stock to occupy the houses; the only possible justification for wintering a lot of late-hatched pullets is in that fact, that one has nothing else to winter.—Am. Poultry Advocate.

50 Cent Eggs

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

Poultry Show Dates

Los Angeles, at Chutes Park, Jan. 6-12, 1908.—Second Annual Exhibition Breeders' Association of Southern California. Dr. Winslow, president; H. A. Meserve, secretary. Birds will be received January 1st. Judged by score card and awards read before public is admitted Monday, January 6th.

Pomona, Cal., Jan. 6 to 11, 1908.—First annual show of Pomona Poultry Association. Write C. C. McKey, 372 W. 2nd St., for remium list.

PRACTICAL HENS' NESTS.

The following description applies to a model of my hen's nest that I used as an illustration in a poultry talk at our local institute. It seemed "to take," so I thought that a description of it would be of some interest to your readers.

The plan of the nest is original with me, and the idea is that it can be easily and thoroughly cleaned, and also that it does not serve as a roosting place at night for the hens, as many nests frequently do.

The nests are made somewhat as follows: The bottom of one set of nests consists of a single board that rests on cleats or strips nailed on the upright end boards. The bottom can be removed at pleasure, drawer fashion, leaving the nests bottomless so that the old nest material, dust and louse-harboring filth, all drop out. There need be no boards nailed on back of nests, as the wall of the building where the nests are placed serves as a back. I place my nests so that the bottom of the nest is two or two and one-half feet from the floor, thus saving floor space. A 1x2-inch strip fastened perch-like, about six inches in front of nests, is very convenient for a hen that wants to lay, as she can pass along on it until she comes to a vacant nest. A board of nearly the width and of the same length as the top and hinged to lower edge of top can be laid back during the day, leaving the nests open, and let down at evening, closing the nests and then the hens have just one place to roost and that where they belong, on their perches.

Any number of nests in a set can be made, suiting the number to the convenient wall space. Mine vary from three to six, or about 15 nests in all, in each of my two buildings. If plenty of nests are provided and they are kept clean, and enticing nest material and china nest eggs are used, hens that have range will seldom steal their nests away. Rural World.

HIGH AIMS.

Little Johnny, having in his possession a couple of bantam hens, which laid very small eggs, suddenly hit on a plan. Going the next morning to the fowl-run, Johnnie's father was surprised to find an ostrich egg tied to one of the beams, and above it a card, with the words: "Keep your eye on this and do your best."—Tit-bits.

My hens had all quit laying. I knew not the reason why. Until I asked the old cock for the cause, and he gave me this reply: "The ladies are out upon a strike. They are greatly aggravated. The old white nest egg's out of style. They want it decorated."

Occasionally you meet a man with a strong will who could add to his popularity by vowing not to brag about it.

Top Prices for Poultry

Suppose your flock of chicks or old fowls will average a certain weight at market time. Suppose you so handle them as to make each weigh a full pound more than you expected. That would be a nice, clean, extra profit, wouldn't it? Do you know that

DR. HESS Poultry PAN-A-CE-A

given as the makers direct, will help a fowl to digest and use such a large portion of the daily feed that it actually grows larger and heavier than it would be possible to make it without Poultry Pan-a-ce-a? This is true. Poultry Pan-a-ce-a contains the bitter tonics to act upon the digestion, iron for the blood and nitrates to expel poisonous matter. It is the prescription of Dr. Hess (M.D., D.V.S.) and is a guaranteed egg-producer as well as flesh-former. Makes chicks mature early and also prevents poultry disease in old or young.

Poultry Pan-a-ce-a is endorsed by poultrymen in United States and Canada. Costs but a penny a day for 30 fowls.

Sold on a written guarantee.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Planting on Wet Land.

In your issue of Nov. 28th I note the enquiry of E. R. J., who wants something that will grow on light, mellow land that is partially covered with water during a portion of the year.

Of course, it is not safe at this distance to say positively that anything will grow there, especially as I do not know how cold it gets in winter or what the condition may be as to alkali, etc. But I think it very probable that the enquirer could succeed in growing either *Eucalyptus botryoides* or *E. robusta*.

Some years ago I had a small piece of wet land which grew nothing except cattails and willows. I planted a portion to each of the above varieties of eucalyptus and was very successful and have since recommended these trees to several friends who have planted successfully in ground that had become so filled with water as to drown out orange and lemon trees.

I now have young trees two years old that are growing right in among cattails and rushes. At one time the ground in which some of the trees were planted was covered with water three or four inches deep for nearly three months. While in this condition the little trees stopped growing for a time, but by the time the surface was dry enough to walk on, they were again growing vigorously. I am now planting along a little creek running through my place where at present willows and small cottonwoods are about all that grow.

I find that both of these eucalypts will stand a moderate amount of alkali and will stand considerable more frost than the blue gum though, of course, like all of the eucalypts they will not grow if there is very much frost to contend with.

The *Eucalyptus robusta* is known in Australia as Swamp mahogany,

but unfortunately, it has been planted in this country quite extensively in dry locations as a shade and ornamental tree and has nearly always proven a disappointment, owing to its inability to stand drought and because its limbs were so brittle that they were constantly breaking off leaving a very unshapely tree. When grown in wet land it appears to be less brittle and makes a much prettier tree. The wood is not very good for fuel, but is said to make good fence posts. The tree blooms very profusely along about Christmas and is valuable as a bee tree. The tree when grown in favorable locations is certainly as pretty as one could reasonably wish, but is absolutely unfit for planting in dry situations.

The *Eucalyptus botryoides* is known in Australia by the name of Bastard mahogany, and is also sometimes called Swamp mahogany.

I believe this tree is superior to the robusta for general planting, as it seems to grow faster and, larger in this part of the country than does the robusta. I also think the temper is of a better quality, but with me it

has not proven so pretty a tree nor so good a bloomer as the robusta.

In planting these trees in wet land I have simply used a brush ax to cut down the brush and rushes so as to let in the sunshine, and have then dug a hole for the plant with a shovel. After planting the tree I raked some of the grass back around it for a mulch. Then I let it alone except that later I cut back some of the willows that were growing so fast as to shade the young trees. Some of the trees grew ten feet the first year, but I found that the best growth was in land that was not covered with water, although water was within a foot or so of the surface.

I have little doubt that these trees will grow in many places that are now practically waste land, and will not only improve the appearance of the place but will yield a very fair revenue in the way of fence posts and other timber.—J. H. Dodson, El Cajon, Cal.

Alfalfa Tainting Milk.

A subscriber of Washington, Nevada county, wishes to know if feeding alfalfa will taint milk. If so, how can it be overcome?

No! The taint of alfalfa is from the outside of the cow. When the alfalfa is rank it is well to bring the cows in from the pasture half an hour before milking time and allow them to stand around until they have breathed off the gases. Cover all droppings made while milking at once with land

plaster; if the plaster or gypsum is not easily to be had, use dry earth. Have a box filled with it and a shovel ready to use at once.—M. E. S.

Plants for Overflowed Land.

Regarding query as to plants on overflowed land E. R. J., who recently asked information, is promised further information if he will write W. J. Curry, Bells.

Logan Berries and Dewberries.

In your question and replies columns, will you state if there is any book or pamphlet published in California on the culture of Loganberries and Dewberries? When should Loganberries be pruned, and what length should the vines be pruned? What is the best way to trellis them, low or high or let them just remain on ground? Should the Dewberries receive the same treatment as the Loganberries?—A New Subscriber.

There is no such book. See Mr. Lobingier's article in vegetable garden department last week.

Squash Seed.

Please inform me through the Queries Department how to get seed out of Hubbard squash in marketable shape. I have 25 tons of squash that I am unable to sell, and would like to keep the seed.—F. W. Steward, Santa Clara.

The only way to save these, so far as we know, is to open and remove the seed, which are thrown with the pulp and fiber connected with them on a coarse screen, fine enough so that

ANTIOAK LEATHER COMPANY

Tannery and Factory Alameda and Slauson Ave.

LOS ANGELES, CALIFORNIA

the seed will not wash through. A hose with water under strong pressure will drive the pulp away from the seed, which can afterwards be dried in the shade and put in sacks for the market. It would not be best to rot down this pulp, because it might possibly injure the seed.

Pruning Eucalyptus.

I planted some Eucalyptus about nineteen months ago, and am told I should trim the lower branches from them, but others say not to do so, but leave them stand.—A. B. C., San Dimas.

We would prefer very much the advice of the latter, and should leave all limbs on the tree until they naturally drop off, unless they are near a walk or where it is objectionable to leave them on the tree. This will give a larger and stockier trunk.

Fern Ball.

I have read with deep interest the article under the "Department of Ornamental Garden" in the "California Cultivator." What treatment should be given to a Japanese Fern Ball? Several weeks ago I received one, and although I have given it plenty of moisture it still remains dormant. Should it be put in a wire basket or surrounded with dirt?—Mrs. F. H. S., Nordhoff.

Do not surround the ball with dirt but simply keep provided with moisture and it will doubtless be all right as soon as warmer weather comes. This is the dormant season for that particular plant, and it needs the warmer weather to bring it out.

Pruning Loganberries.

Please give best methods of pruning and trellising loganberry vines. My vines of last year's growth are from ten to fifteen feet long, and the ground has been heavily manured. I think I can get better berries by pruning back.—J. C. James, Atwater.

Last week's Cultivator had so complete an answer to this in vegetable department, written by Mr. Lobingier, that we refer our inquirer to that paper for his answer.

Dissolving Bluestone.

Kindly tell me how best to dissolve bluestone. Does mixing lime and

bluestone together kill the strength of either?—R. Winters.

To dissolve bluestone, suspend in a cotton bag in the barrel or vessel of water which is to be added to the lime solution. As to adding the two together, note the instructions which have been given in the Cultivator and have each well dissolved and diluted before bringing together, then to secure the most perfect results, the two may be poured together into the water with constant stirring. This gives a perfect mixture.

Clean Winter Cultivation.

Is it best to plow and cultivate a young orange orchard now or would it be well to allow wild oats, burr clover, etc., and plow them over in January or February?—W. V. H., Porterville.

There is a diversity of opinion as to clean culture or allowing cover crops to grow for plowing under. But we think the cover crop advocates are winning and becoming more numerous and the practice is more generally followed each year. This is especially true at Riverside, where formerly the cleanest culture prevailed. It is now too late to plant peas or legumes for the purpose of making a cover crop, but any natural growth of the land should be encouraged then plowed under with a heavy chain on the plow or disked into the soil as some prefer.

Frost Protection.

Has it been demonstrated by actual experience that smoke and smoke alone is a frost protection for citrus groves? If so, to what extent?—R. H. G., Fullerton.

The smudging or smoking method of frost protection has been almost generally abandoned, as its effect was found to be so extremely slight as to be of little value. The method now generally used is the direct coal fire in baskets or the briquette fire in small stoves. The effort being to secure direct heat with no effort whatever to secure a smudge. The

objection to the smudge or smoke was that it injured the fruit, and the condition of atmosphere is such at time of frost that even immense quantities of smoke are dissipated and of little value in raising temperature.

Plowing Old Alfalfa Land.

I have some alfalfa land which is four years old not irrigated for the past two years. I wish to plant vines. How can it best be killed out.—P. J., Lodi.

The best method we have seen for handling this is with a sharp steel plow sent into the ground deep enough and with a narrow enough cut that a perfect turn-under is made of the roots and top. To accomplish this best, of course, the soil would have to be fairly well moistened.

Moles.

Please tell me through the Cultivator how to get rid of moles?—C. B. W., San Jose.

The only method which we have found that works with the mole is a trap specially made for them. In the writer's own lawn all kinds of efforts were made to poison and to capture by digging long distances in the burrow, but always in vain. Finally a trap was purchased; it was the Peerless, we believe, which has two separate sets of jaws, one on either side of the trigger. A fresh part of the run is taken and with the foot the raised soil is pressed down firm and hard and the trap with one jaw on one side of this firmed ground the other on the other. This brings the trigger directly over the ground which was pressed down into the run. As the mole comes through the run he forces the earth up again which springs the trigger and he is a dead one in the trap.

Los Alamitos sugar factory produced 13,000,000 pounds of sugar this season. This is more than its last year's output, though the acreage of beets this year was only 6000 as against 7000 last year.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

THE HOWARD SALE.

The sale of fifty thoroughbred Shorthorns at the Howard sale last month was a successful affair. The prices were not as high as the first annual sale, but this is explained, doubtless, by the financial condition this year not being as favorable as last year.

Mr. Howard says of Mr. Geo. P. Bellows who conducted the sale: "His usual apt and business-like manners wins, and it is worth an admission fee to hear and see him."

The sales made were as follows: Cows and Heifers.

Orinda Lass, Henry Eakle, Woodland, Cal., \$140; Philomena 63rd, J. C. Hodges, Monterey, Cal., \$110; Princess 22nd, F. Bishop, Guadalupe, Cal., \$80; Philomena 64th, J. C. WHEN DADDY LIGHTS THE TREE.

We have our share of ups and downs,
Our cares like other folks;
The pocketbook is sometimes full,
We're sometimes nigh dead broke;
But once a year, at Christmas time,
Our hearth is bright to see;
The baby's hand just touches heaven
When Daddy lights the tree.

For weeks and weeks the little ones
Have lotted on this hour;
And mother she has planned for it
Since summer's sun and shower,
With here a nickel, there a dime,
Put by where none should see,
A loving hoard against the night
When Daddy lights the tree.

The tiny tapers glow like stars;
They mind us of the flame
That rifted once the steel-blue sky
The morn the Christ-child came.
The blessed angels sang to earth,
Above that fair country,
We think they sing above our hearth
When Daddy lights the tree.

The weest child in mother's arms
Laughs out and claps her hands;
The rest of us on tiptoe wait;
The grownup brother stands
Where he can reach the topmost branch,
Our Santa Claus to be,
In that sweet hour of breathless joy
When Daddy lights the tree.

Our grandpa says 'twas just as fine
In days when he was young;
For every Christmas ages through
The happy bells have rung.
And grandpa's head is growing gray,
But yet a boy is he,
As merry as the rest of us
When Daddy lights the tree.

'Tis love that makes the world go round

'Tis love that lightens toil;
'Tis love that lays up treasure which
Nor moth nor rust can spoil;
And love is in our humblest home,
In largesse full and free;
We are all very close to heaven
When Daddy lights the tree.

—Margaret Sangster.

THE ORPHANED TWINS' CHRISTMAS TREE.

MINNIE and Tom were twins; they were also orphans and lived with a farmer and his wife out on the Great Plains. These farmer folk had lived neighbors to the children's parents before the death of the latter.

Baker was the name of the farmer and his good wife who had opened their hearts and poor little home to the two bereaved orphans.

The fall just passed had been a sickly time for the "settlers," and the parents of Minnie and Tom had died of typhoid fever within a few days of each other, leaving their little ones almost destitute; and had it not been for the kindness of the neighbors, the lot of the little twins would have been a sorry one, indeed, for they must have become "county charges" and been sent to the county poorhouse.

The Bakers were young married people who had come from the East to win a home for themselves on the wild, new prairies, and until Minnie and Tom became inmates of their home it had been a childless place. But this had been no cause for mourning, rather a reason for rejoicing, for they felt too poor in the world's goods to long for children to share their poverty and the accompanying hardships.

"When we get our land deeded, good crops growing, a new house, and the place well stocked—then we will pray our Creator to send some little ones to make our happiness complete," said Mrs. Baker one day when the subject of children was being discussed.

But providence had seen fit to send

a pair of seven-year-old tots to them long before the farm was theirs on a bit of legal paper, and when the meager two-room, sod-covered stone house was yet their only abode. To be sure there were a few comforts—in a small way—which the good, light hearted young couple made the most of. During the summer they had both worked with great energy, Mr. Baker cultivating the corn, cane and potato crops, while his wife looked after the garden, the chickens and cows. With butter and eggs she had almost kept up the running expenses of the house, bought feed for her milch cows till the corn was gathered and the hay and fodder cut and stacked; and while plenty did not abound, their thrift and economy kept them comfortably clad and fed, besides allowing them to begin laying away provision for the next year when their fields should be broader and more machinery would be needed to carry on the work.

And then it was they had found two homeless little ones knocking at their house and hearts for admittance.

The Bakers had talked the matter all over when the parents of Minnie and Tom became dangerously ill, with no possible chance of recovery. And they agreed that whatever the new responsibility and extra expense might be in taking the children they would willingly do the best in their power to make the orphans happy and try to fill, in a measure at least, the place left vacant by their parents.

Thus it came about that after the death of their parents Minnie and Tom found themselves installed as members in the Baker household. For weeks and weeks the two little sorrowing orphans grieved heart-brokenly over the loss of their loved mamma and papa, weeping against the breast of their new mother, who gently caressed them, telling them in a sympathetic voice, often choking with emotion, of that land—all glorious—where some day they would go to be received into the arms of those two dear ones who would await their coming. Thus lovingly she lightened the burden on their hearts, and as the fall slipped into winter, and the days glided swiftly toward Christmas, the children began to take an interest in the new life about them.

Until the very cold weather of December set in, Minnie and Tom had gone regularly to the district school, some two miles distant from their home, but with the first blizzards from the frozen north they were obliged to do their lessons at home with the ever willing assistance of their foster mother.

One evening after the children had been put to bed in the "front room" (which served as bedroom for them all) the Bakers sat chatting awhile by the kitchen fire. Mr. Baker had been reading aloud from the county seat weekly newspaper, and, as that sheet was exploiting the coming of Christmas by way of big-line advertisements, inserted by the merchants of the town, Mr. Baker was set thinking.

"Say, Mattie," he remarked, after a few minutes' meditation, "do you s'pose we could do something for Min and Tom Christmas? It does seem tough for the little fellows to have no Santa Claus, sure it does."

"Oh, I've been thinking of that for

Also Primary Manufacturers of High Grade Fertilizers. Write for our free booklet, "Farmer's Friend," valuable to all farmers and ranchers.

some time," answered Mrs. Baker, "and, knowing we have so little money to spend even for real necessities—for that note of \$60 falls due New Year, you know—that I've conceived an idea to give them a little surprise with still smaller outlay."

"What is your plan?" asked Mr. Baker laying aside the paper and poking up the fire.

"Well," replied his wife, "I've partly carried it out. I'll show you what I've done." She rose, and going to a corner where an old trunk stood under the wall cupboard, she lifted the lid and drew forth from its depths a huge bundle done up in an old apron. From this she extracted the large body of a rag doll, headless. Its feet were shod in red satin slippers, made evidently out of a bit of ribbon. Otherwise the doll was undressed. Holding the doll up for inspection, Mrs. Baker said: "I've made this at odd times on nice afternoons when the children were at play in the stable. I have yet to make the clothes, you notice; but I have the necessary material at hand. Do you remember that white swiss dress I wore the summer you first came to see me? Well, much of it is pretty good—the back breadths—and there is a vast plenty to fit dolly out fine. Then I've some red satin ribbon off an old hat which can be pressed and used for a sash and bows on the sleeves. I think I can scare up a bit of lace to go about the bodice—it doesn't matter if it is darned."

"But, Mattie, where's the thing's head?" asked Mr. Baker, taking the headless doll in his hands.

"Well, dear, I'm afraid we'll have to buy one," said Mrs. Baker, almost coaxingly. "I see they advertise big china heads at Jones' for 25 cents. When you go to town next Saturday you may get one, if you think it is not too extravagant," and Mrs. Baker looked inquiringly at her husband.

"No, that's all right," he answered her, assuringly. "If the little chaps were ours, you know, we'd do it in a minute, and it's nothing more'n right to do the same for these motherless things. Poor souls won't get much at the most. Now, what have you got for Tom?"

"I've a pair of blue wool mittens almost done," answered Mrs. Baker, lifting a bunch of color from her work basket. "And I mean to knit him a toboggan cap in bright red—one with a tossel over the ear like the boys in town wear."

"But those fixin's are not playthings," ventured Mr. Baker. "Now, the doll for Minnie is all O. K.; but Tom must have a toy, too."

"I've not finished telling my plan yet," laughed Mrs. Baker. "Now, I know you are clever with the carpenter's tools, and I want you to make a nice sled for him to coast with. You may have that big goods box I use in the dugout as a table. I can make out with something else down there. There is enough lumber in that to make a great sled, and both the children can have fine sport coasting down the hill toward the chicken house. I half expect you and I will take a hand occasionally when the snow is good. And since we have decided to spend a quarter on Minnie, I think we must put out the same amount on Tom. There are very nice bugles advertised for 25 cents in town. Suppose we get one for him—the noise

of a horn will just fill the bill with a boy. Along with the other things I can fix up here at home the doll and bugle horn will be quite enough, considering our circumstances—unless—we might afford a dime's worth of mixed candy and nuts."

"Yep; we'll go the extra dime," agreed Mr. Baker, "if we have to make old man Jamenson throw it off that \$60 note. The old fellow wouldn't miss \$10 on these children if he could be induced to see it that way. I bet he's worth \$5000, if he's worth a cent."

"Can you get at the sled tomorrow?" asked Mrs. Baker. "You must do it in the stable so the children won't see you."

"Yes, for I can't do much else this cold weather," replied Mr. Baker. "And, come to think of it, I wouldn't wonder if I can get some red paint from old Jamenson to paint the sled with. He had a lot to give his sulky plow a coat. If he's any left I'm sure he'd be willing to donate it to a good cause."

"Oh, that'll be fine!" exclaimed Mrs. Baker, her face beaming with pleasure as their plans developed.

So the days before Christmas wore away, and both the Bakers performed many little tasks that were kept a secret from the children. Much of their work was done after the little ones had gone to bed at night, and it was truly amusing to see them go cautiously about the kitchen on tiptoe, speaking in whispers, that they might not waken the sleepers for whom they were busy preparing a surprise.

The accomplishment of one thing would lead to the making of something else. After Mr. Baker had completed the sled he found that he had plenty of lumber left over to make a little tea table, at which the children might have their "play dinners." Then, after the table was done, there must be dishes to set it with, and Mrs. Baker brought from a packing box—that had never till now been opened since coming west—several dear little bits of china and glass that had been given her in her own childhood. There were several tiny plates, with pictures of birds and flowers on them; two dainty teacups, decorated with gold bands and handles, with saucers to match; a pretty cream mug, a sugar bowl that looked like a lily on bits of feet, a wine glass and a dear, fat little teapot, around whose plump body ran a spray of roses. A red and white checked napkin with mottled red and white fringe, answered for a tablecloth, and when the table was spread—just to try the effect—Mr. Baker looked at it approvingly, and said: "It's out of sight, Mattie Say, it don't take so all-fired much money to do nice little things when one's willing to work, now, does it?" And then he put the finishing coat of red paint (which, by the way, old man Jamenson had left on hand, and which he gladly let his neighbor have) on the sled, which he hung up on the wall behind the cook stove to dry over night. "Now," he added, turning to his wife, "after I got the doll's head, the bugle and candy, everything will be about ready, eh?"

Concluded Next Week

Pat—Do yez ever git dispondint, Molke?

Mike—Only when Ol'm feeling "blue." Ol' always feel good as long as Ol'm feeling folne, he gobs!—Puck.

RECIPES.

Roast Goose.

Stuff the goose with a dressing made as follows: Potatoes boiled, peeled, and mashed fine and light; 1 tablespoon salt; 1 teaspoon pepper; 1 teaspoon sage; 2 tablespoons of onion juice; 2 of butter. Truss, and dredge well with salt, pepper and flour. Roast before the fire, (if weighing eight pounds), one and one-half hours; or in the oven, one and one-quarter hours. Make gravy as for turkey. No butter is required for goose, it is so fat. Serve with apple sauce.

Roast Duck.

Ducks to be good must be cooked rare; for this reason it is best not to stuff. If you do stuff them, use the goose dressing, and have it very hot. The better way is to cut an onion in two, and put in the body of the bird, then truss, and dredge with salt, pepper and flour, and roast, if before the fire, forty minutes, if in the oven, thirty minutes. The fire must be very hot and the oven a very quick one. Serve with currant jelly, and a sauce made the same as for turkey.

Roast Pig.

Select a pig from four to six weeks old. Clean it thoroughly, using a teaspoon of soda in the water you wash the inside with. Wipe dry and stuff with a dressing made of bread crumbs highly seasoned with butter, sage, salt and pepper. Sew it up. Skewer the fore legs forward, and the hind legs backward. Rub it over with butter, and sprinkle with salt, pepper and flour. Put it in a dripping pan with a little water and bake about three hours, basting often. It is not necessary to have the oven very hot at first; be careful not to let it burn. When done, place it on a platter; garnish with parsley and put an apple or small ear of corn in its mouth.

Roast Spare Ribs.

Trim off the rough ends; crack the ribs across the middle, rub with salt, sprinkle with pepper, fold over, stuff with plain turkey dressing. Sew up tightly, put in dripping pan with a pint of water. Baste frequently, turning once, so that both sides may be of a rich brown.

Beets.

Be careful not to prick, or cut the skin before cooking, as they will then lose their color. Put them into boiling water, and boil until tender. If they are served hot, season them with butter, pepper and salt; if cold, slice and pour vinegar over them, or cut in dice, and mix with other cold vegetables for a salad.

Baked Onions.

Onion; butter; bread crumbs; salt; pepper; sweet cream. Boil the onions in salted water until tender. Butter a deep baking dish; fill alternately with a layer of bread crumbs sprinkled with pepper, salt and bits of butter, then a layer of sliced onions, until full, having bread crumbs on top. Cover with sweet cream. Bake half an hour, or until brown. Serve hot in the same dish.

Mashed Potatoes.

Six medium-sized potatoes; 1 tablespoon butter; a little hot milk; salt and pepper to taste. Bake the potatoes; when done, cut off a small piece each end, with a spoon, remove the skin, which mash and heat well and season with hot milk; add the butter and season with salt and pepper to taste. Fill the skins with this mixture and brush with melted butter. Bake in the oven.

Baked Hubbard Squash.

Cut in pieces, scrape out the seeds and soft part, bake from one to one and one-half hours, according to the thickness of the squash. To be eaten with butter and salt like baked potatoes.

Baked Diced Turnips.

Turnips, cooked in salted water; cream gravy; cracker crumbs. Cut the turnips into dice, and cook in the salted water; when done, put into a colander and douse with cold water; then place in a baking dish and pour the cream gravy over them, cover with cracker crumbs and bake until brown.

Baked Tomatoes.

Tomatoes; butter; salt; pepper. Cut a piece the size of a quarter dollar from the stem end of large smooth tomatoes, put in each a salt spoon of salt, half as much pepper, butter the size of a nutmeg; set them in a pan and bake nearly an hour. Particularly good with lamb or mutton chops.

Cheese Salad.

Sprinkle grated cheese over crisp lettuce and serve with either French or cooked mayonnaise dressing.

Lettuce Salad.

Dressing. Half cup of vinegar; 1/2 cup sweet cream; a tablespoon sugar; a pinch each of salt and pepper. Wash the lettuce, dry with a towel; place in salad bowl, and pour the dressing over it.

Tomato Salad.

Use tomatoes the size of an egg. Remove the skins and a little pulp, from the stem end; turn them to drain and keep them on ice one hour, then fill with mayonnaise. Serve with lettuce and garnish with hard-boiled eggs and green peppers; cut as fine as possible.

The lettuce should be washed, and kept on ice several hours, being careful to shake out all the water.

Mince Meat—An English Recipe.
One pound finely chopped kidney suet; 2 pounds raisins, chooped fine; 3 pounds currants, cleaned and dried; 3 pounds apples, chopped fine; 1 pound candied peel chopped fine; pound sugar; rinds of 3 lemons, grated; 1 small teaspoon salt; 1/2 ounce mixed spice; 1 pound lean meat. Mince the lean meat very fine. Mix all well together.

Squash Pie.

Two heaping tablespoons squash; 1/2 coffee cup sugar, granulated; 1 egg; scant 1/2 teaspoon level full of cinnamon; same of ginger; pinch of salt; 1 large teacup rich milk.
The Hubbard squash is best and should be steamed. Mash it through a colander. Beat the egg thoroughly, then add the sugar, salt, squash, cinnamon and ginger, and beat well together, then add the milk. Stir it in well. Bake with one crust. This makes one pie.

Lemon Pie.

Three-quarters cup sugar; 2-3 cup water; 1 lemon; 3 eggs; 1 tablespoon butter; 1 tablespoon flour. Cream butter and sugar; add flour, yolks 3 eggs—well beaten, water, 1 lemon, and piece of rind. Beat the whites of the eggs very light, with a tablespoon of sugar to each egg, for a meringue; flavor this with lemon juice. Spread it over the pie when baked, and put it back in the oven until it is slightly browned. Use half the grated rind and all the juice of the lemon.

English Plum Pudding.

Twelve eggs, well beaten; 2 pounds beef suet, chopped fine; 2 pounds bread crumbs; 1 1-2 pounds flour; a pound stoned raisins; 2 pounds currants; 1 pound Sultana raisins; 1 pound sugar; 1-2 pound candied peel, 1 nutmeg and 1-2 ounce mixed spices; rind of 2 lemons grated; 1 small teaspoon salt.
Mix well together and add the eggs. If not moist enough, add a little molasses and water. Put into buttered molds, or tie up safely in one large ball and put into boiling water. This will make 3 good-sized puddings.

A Christmas Suggestion by

About the best, all-around, most acceptable present you can make one is a Camera. We can supply you with anything from a big \$35.00 affair to a dandy little Brownie. You can trade as well by mail with us as you can over the counter. Send for a Catalogue.

FRUIT LANDS FOR SALE.

BEAUMONT FRUIT LANDS SURPASS ALL others in quality. The fruit took the world's capital prize at the World's Columbian Exposition against the finest products on the globe. Experts pronounce the soil, water, sunshine and other natural advantages of Beaumont superior to any other locality in Southern California. Prof. D. C. Burson recently of Pasadena, and for many years a tree expert in the government service visited Beaumont and became so fully impressed with its future that he instituted a horticultural department in connection with this company and a nursery on his own account at Beaumont. His experience and knowledge is at the command of all prospective and actual purchasers of fruit lands. Beaumont poultry is superior, as the conditions are such as to produce the highest development. Well known experts pronounce Beaumont better than any other section in the entire State. W. J. Baker, a prominent breeder of fine strains at Pasadena, has opened the Beaumont Poultry Yards at Beaumont, feeling confident that great opportunities will follow the rejuvenation of this important little city on the hill. Prices: Fruit lands in 5 and 10-acre tracts, \$75 and up. Average for grain, grapes and poultry, \$85, \$90, \$100 per acre. City lots \$70 and up. Easy terms of payment. Excursions from Los Angeles twice a week, Sundays and Thursdays, 16¢ miles there and back, \$1. Come in for information or cut out and mail this coupon.

Beaumont Land and Water Co.

ESSAYS ON POULTRY CULTURE.

In another column will be found a proposition for a contest for the best essays on poultry culture. The Success Incubator Co., of White Salmon, Washington, offer 100 premiums for the best of these essays. Every contestant is promised one special premium in any case, and the larger prizes go to the winners.

The judging is to be based on the statement of facts and experience, rather than on literary merit. It sometimes happens that those whose experience is the most valuable cannot express as well as others, but those who can make known those experiences are promised just as good a show as the more literary.

A letter to the company will secure further particulars.

POULTRY FEEDING FOR PROFIT.

The Coulson Co. of Petaluma has issued a fine little booklet of 44 pages, a catalogue and price list of the poultry goods and poultry supplies. Like all printed matter from the firm it is full of illustrations and has a whole lot of interesting matter in the text.

Of course, the major feature is the goods for sale at attractive prices, but much of interest to all in the book makes it well worth the writing for.

Geo. A. Parkyns, president and general manager of the Imperial Valley Improvement Co., has resigned from its management and has been succeeded by Senator Blair and J. S. Giles.

Annheim shipped five carloads of sweet spuds.

Domestic Swiss... 21@22
Oregon... 18

Eggs and Poultry.

Eggs have declined heavily during the week and are now quoted for local candled 38@40 or nearly 6 cents lower. The slump is caused by the throwing on the market of vast quantities of storage eggs. The cold storage operators are loaded with eggs that must be disposed of within the next month and the daily consumption of eggs at present prices is not great enough to move more than half of the cold storage holdings. By lowering the price of fresh eggs to nearer a par with Eastern selected, there will be a larger consumption of eggs and the retailer unable to meet this increased demand with strictly fresh stock will increase his supply of storage.

Eggs local candled... 38@40

The Chas. H. Lilly Company have just published their 1908 catalogue of seeds and poultry supplies, and it certainly is a beautiful edition and one of the best achievements of its kind ever issued. Many people are calling it the Farmers' Guide for it contains full cultural directions and tables, as well as a general list of seeds and supplies. Each copy contains 112 pages of this valuable information, 16 colored photographs of specialties that are particularly suited for the Pacific Coast, and 293 other photographs of vegetables, flowers, grains, tools, incubators, brooders and poultry supplies. The 16 colored photographs are the most perfect in detail of anything ever yet printed in a seed catalogue. They are not exaggerated drawings, but actual scenes photographed by the Advertising Man, of specimens grown from Lilly's Seed while growing on the Pacific Coast. They were taken at random wherever he happened to be, while making his inquiries and researches. The description of the goods, too, is correct and complete. The division of the different goods into classification is also most accurate. All together, it is a most desirable Seed Catalogue and one that every farmer, fruit grower, horticulturist or poultryman should have on hand. The edition consists of 40,000 copies, a complete copy of which will be sent to any address on request.

San Francisco Markets

SAN FRANCISCO, Dec. 17, 1907.

Butter.

Butter recovered its former loss and is again at 25 for California extras. Market is fairly firm with no indication of an immediate change.

The current prices on dairy products in San Francisco are always from 2 to 3 cents higher than the rates given in the daily official list of the Wholesale Dairy Produce Exchange. The retail dealers in this city invariably pay an additional 2 cents per pound on butter and per dozen of eggs, and occasionally it is 3 cents. On cheese the increase is 1 cent per pound. By making these additions to the Dairy Exchange prices the producer in the country can always determine the actual prices ruling in this city. The quotations as prepared by the San Francisco Wholesale Dairy Exchange yesterday were as follows:

California extras per lb.	35
California firsts.....	31
California seconds.....	25
Eastern extras.....	27½
Storage Cal ex.....	27½

Cheese.

Citrus Market

LOS ANGELES, Dec. 18, 1907.

The orange market is much stronger than a few days since and the promise is for good returns for the holiday fruit. The fruit has been of exceptional quality and has found a ready sale. This is, doubtless, in part due to the bettering of the money market, which has occurred.

Lemons are moving well and fair returns received for them.

Total shipments to date, 1709 cars, of which 474 are lemons. To same date last year 864 cars, of which 281 were lemons.

NEW YORK, Dec. 16.—Twenty-three cars of navels, five cars of lemons and one car seedlings were sold. One car of Arizona navels was sold also. There is a good demand for well colored navels, but the market is weak on off-colored stock. Lemons are steady. Weather cool, cloudy.

SCIENCE AND FARMING.

One of the many important facts in modern farm science most worth the attention of farmers who think, is the new system of feeding live stock. Present ideas which have grown from and out of old-time methods within comparatively recent years, put the whole feeding question on a truly scientific basis. The proportion and composition of foods is fully explained by agricultural science and wise breeders and feeders pay sufficient attention to the subject to reap great benefit from it.

Facts upon which the entire structure of the cattle feeding business rests are so well attested that there is no gainsaying them, and first and foremost in actual importance is the tonic idea.

It teaches one common sense principle—no animal under the continued strain of heavy feeding can make satisfactory growth or production without the digestive apparatus is strengthened to meet such strain.

To attempt to bring a fine bunch of thrifty steers up to the proper selling weight, or to get a large average production of milk from a herd of cows, leaving nature to settle alone the constant over-drafts made on animal digestion by big, daily rations of rich foods, is simply to upset the very end in view.

If fattening cattle and cows in milk were always at liberty to select what instinct tells them is best or necessary, there would, of course, be no need of the tonic. But here the difficulty arises.

Choose or select for must eat what the and besides endure a for weeks and months. der that an overtaxed organism breaks under

Give your cattle a tonic—something to strengthen digestion—and growth will be continuous because there can be no interruption caused by indiges-

tion, loss of appetite or complications of a more serious nature.

Another great advantage in the tonic idea is its economy. Cattle receiving it, because of greater appetite, eat more rough fodder and thus reduce feed bills.

Besides, it is a well-established fact that there is great saving of nutriment where the tonic is given, which would otherwise enrich the manure heap.

Without going further, then, into details, this one fact stands out above everything else in the new farm science—a "food tonic" is a necessity.

Eminent medical writers, such as Professors Winslow, Quitman and Finley Dun, tell us certain elements are always beneficial—bitter tonics, which aid and strengthen digestion, iron, well-known as a blood builder, and nitrates, which act as cleansing agents to remove poisonous matter from the animal system. These are the ingredients found in the tonic and healthy growth, production and condition are sure to follow in cattle, horses, sheep or swine when these elements are given.

A JUST AMENDMENT.

At this session of Congress there will doubtless be a flood of proposed amendments to the Interstate Commerce Law. One which, it seems to us, has a large amount of merit is aimed to prevent any sudden change in interstate freight rates without first giving the shipper an opportunity to be heard. Under the present procedure, railroad companies simply file their tariffs, which become effective in thirty days. If the shippers feel aggrieved, they file a complaint with the Interstate Commerce Commission and the courts. In Canada all freight tariffs must be approved before becoming effective. and that seems to be much the better method, for in this country the delays amount to almost a denial of justice. In some cases fifteen months have elapsed after the complaint has been filed before a decision has been rendered. During all this long period shippers must suffer. When a rate has been in effect for several years, the railroads cannot suffer seriously by its continuance pending investigation. It seems to us there can be no reasonable objection to the passage of the proposed amendment.

JAMESTOWN EXPOSITION AWARDS.

Announcement has just been made by the Awarding Jury of the Jamestown Exposition that the International Harvester Company of America has been awarded several medals and diplomas. This company was awarded a diploma of a bronze medal for the installation of their exhibits in the States Exhibit Palace. Their exhibit included the display of modern farm implements and harvesting machines. This company was awarded the diploma of a gold medal for their auto buggy, hay tedder, manure spreader, feed mill, corn sheller, New Bettendorf steel wagon and reversible disc harrow, and a silver medal for gasoline engines and cream harvesters.

The awarding of the above medals to the International line is conclusive evidence of the general excellence of their product, and indicates that the standard of merit which has characterized their product in the past is being faithfully maintained. Those who have visited this exhibit have spoken very well indeed of its general excellence.

A BEAUTIFUL CATALOGUE.

A beautiful 36-page catalogue is just received from the Armstrong Nurseries, located at Ontario. The envelope and cover of the booklet is a brilliant red, and the contents between the covers is so instructively put together that we believe it, too, will be read by a great many interested people. With the text is a large number beautiful engravings of various trees, fruits, roses and other flowers. The rose is given more space than any other one department, although the orange and many deciduous fruits are particularly described. The engravings of ornamental trees are instructive.

The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine straight ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gauge depth to which moldboard should cut. It's a very desirable machine for road-building in city or village. It makes good roads and keeps them so. Although made of steel and malleable iron, still it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, ditching, Land Leveling, Foundation-digging.

For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet, "Delightful Roads." It's free and tells you all about the 20th Century.

A Four-Hundred-Inch Riverside Well

Canal of
Riverside Water Company

Courtesy Tri-Counties Reforestation Committee

A Big Well of Riverside
Which Flowed Nearly
Four Hundred Inches

[F wells and underground supplies of water are to be preserved, forestry should be encouraged. On next page is an article by State Forester Lull and while the article relates more particularly to forestry for lumber purposes, the benefit to irrigation will be none the less pronounced. Every effort should be made to protect these water sheds. On this point Mr. Lull says:

"Then there is the fire problem, rendered so vast by the extreme drought of our summers. Fortunately we have good laws to punish those who are careless with fires, and the existence of over 600

voluntary fire wardens in the State proves the public is vitally interested in their enforcement. Gradually we are learning to think twice before starting fires, though old customs sometimes prevail. Thanks to the efforts of the fire wardens the Board of Forestry has justified its existence many times over by its activities under the laws relating to forest fires. And it will continue to do so until the belief in forestry will be so strong in the State that a popular demand will come for the establishment of a college of forestry at the University of California. This action should be taken, and I believe it will be in the not distant future."

Forestry Necessary to Advancement

A Paper by G. B. Lull, State Forester, Read
at the Recent Farmers' Institute at Davisville

FORESTRY has been defined as the art of producing wood crops. This is not the most comprehensive definition which could be given, yet it answers all practical purposes. As the agriculturist is engaged in the business of producing food crops, so the forester is engaged in the business of producing wood crops, and both are carrying on their art for the ultimate purpose of producing a revenue.

Forestry has been practiced in the United States since July 1, 1887, when the Division of Forestry was created in the Department of Agriculture. Like most other lines of activity it came to meet a need, long foreseen by wise men throughout the country. Thus, as early as 1799 the Federal government recognized by legislation the need of preserving for future use timber suitable for the navy. In 1817 the former Act was renewed and 19,000 acres were reserved for live oak and cedar production on Commissioners, Cypress and Six islands in Louisiana. In 1828 another appropriation of \$10,000 was made and some lands were purchased on Santa Rosa Sound, where during a few years an attempt at cultivation, transplanting and pruning was made. In March 1831, provision was made for the punishment of persons cutting or destroying any live oak, red cedar or other trees growing on any lands of the United States, by a fine of not less than thrice the value of the timber cut and corresponding imprisonment.

It will be noted that no general conception of a need of a forest policy underlay these attempts to secure sufficient material for a special purpose; material of a kind which was not plentiful and was then believed a continued necessity for the building of war ships.

We can now smile at the concern expressed by early writers with regard to the threatened exhaustion of forest supplies. The extent of our forest domain was then entirely unknown, and in the absence of railway communication the location of supplies near the centers of civilization was of more moment. Logging then was carried on only along the coast and the eastern river courses. Small country mills sawed to order for home consumption or sent material to the mouths of the rivers to be carried by vessels to home and foreign markets. The mills were run in the manner of country grist-mills, often in connection with them. This petty method of doing business lasted until the middle of this century, as is evidenced by the census of 1840, which reports 31,560 mills with an average product of about \$400. But note the change. In 1870 the product per mill was valued at \$6500 and in 1890 it had become \$19,000.

It would be difficult to set a date or mark an event from which the changes in the methods of lumber industry, which is now such a stupendous factor in forest decimation, might be reckoned. It came as gradually or as fast as the railway systems expanded and made accessible the vast supplies of the West, while the supplies of the East were being exhausted.

Especially after the war settlements of the West grew as if by magic; the railroad mileage more than doubled in the decade from 1865 to 1875, and with it the lumber industry developed by rapid strides into its modern methods and volume. In 1865 the State of New York still furnished more lumber than any other State, now it supplies only insignificant amounts.

In 1868 the golden age of lumbering had arrived in Michigan; in 1871 rafts filled the Wisconsin; in 1875 Eau Claire had 30, Marathon 30 and Fond du Lac 20 sawmills, now all gone; and mills at La Crosse, which were cutting millions of feet annually are now closed.

No wonder that those observing this rapid decimation of our forest supplies and the incredible wastefulness and additional destruction by fire, with no attention to the aftergrowth, begun to sound the note of alarm. Besides the writings in the daily press and other non-official publications, we find the reports of the Department of Agriculture more and more frequently calling attention to the subject.

In the report issued by the Patent Office as early as 1849, we find this significant language in a discussion of the influence of forests on waterflow and their rapid destruction:

"The waste of valuable timber in the United States, to say nothing of firewood, will hardly begin to be appreciated until our population reaches 50,000,000. Then the folly and short-sightedness of this age will meet with a degree of censure and reproach not pleasant to contemplate."

In 1865 the Rev. Frederick Starr discussed fully and forcibly the "American forests, their destruction and preservation" in which, with truly prophetic vision, he says:

"It is feared it will be long, perhaps a full century, before the results at which we ought to aim as a nation will be realized by our whole country; namely, that we should raise an adequate supply of wood and timber for all our wants. The evils which are anticipated will probably increase upon us for thirty years to come with tenfold the rapidity with which restoring or ameliorating measures shall be adopted."

And further:

"Like a cloud no bigger than a man's hand just rising from the sea, an awakening interest begins to come in sight on this subject, which is a question of political economy will place the interests of cotton, wool, coal, iron, meat and even grain beneath its feet. Some of these, according to the demand, can be produced in a few days, others in a few months or in a few years, but timber in not less than one generation. The nation has slept because the gnawing of want has not awakened her. She has had plenty and to spare, but within thirty years she will be conscious that not only individual want is present, but that it comes to each from permanent national famine of wood."

These and many other urgent writers had their influence in educating a large number to a conception and consideration of the importance of this subject, so that when, in 1893 the committee on forestry of the American Association for the Advancement of Science was formed and presented its memorial to Congress, there existed already an intelligent audience and, although a considerable amount of lethargy and lack of interest was exhibited, Congress could be persuaded, in 1876, to establish the agency in the United States Department of Agriculture out of which grew the Division of Forestry, already mentioned.

Then was presented the spectacle of a nation in need of foresters, possessed of a forestry division and ready for the practice of the forestry art, which had no foresters of her own. The Eastern universities were quick to respond, however, and during the ensuing years Cornell, Yale, Harvard

and Michigan universities and many of less prominence instituted forestry courses. On the graduation of the first American foresters the field of investigations was broadened continuously as new recruits from the universities were added. Thus, the development of scientific forestry and forestry knowledge was extended in the United States as our Wolfville friend says, "like the grace of heaven through a camp meeting."

During this time, however, an anomalous condition existed in the government organization which greatly hampered the benefits of forestry practice. This was the administration of the forest reserves among its employees. Fortunately this condition was rectified by Congress in February 1904 when the forest reserves were transferred from the Department of the Interior to the Department of Agriculture where they were rightly placed in the hands of the Forest Service, as the former Division of Forestry is now called.

The administration of the reserves themselves was quickly placed on a basis of local management instead of the old-time, long-arm management from Washington, which had resulted in the growth of so much ill feeling among reserve users. Under the present methods of management, the just opposition to the reserves has practically disappeared, although we occasionally hear outbursts from selfish interests, as was the case at the recent Denver convention. The area of the reserves (now called National forests) has been steadily increased as the examination of new areas warranted their extension until now they cover a great portion of the mountain area in our Western States. In California alone their area exceeds 21,000,000 acres, occupying practically all the higher mountain slopes of the State.

With the firm establishment and successful development of Federal forestry, action for similar work began in many of the States. In California it began as early as 1885 when this State, preceding any other in this particular, passed an act establishing a State Board of Forestry. This board was not composed of trained foresters. It acted functionally as a Bureau of Education, issuing three reports, botanical in nature, before it was abolished in 1893.

The present State Board of Forestry was created in 1905 after a thorough examination of the forest resources of the State by the Federal Forest Service. The creating law provides that the State Forester shall be technically-trained and outlines work along the lines of forest management, forest replacement and forest protection.

The question has arisen—Why should California support a Board of Forestry when the Federal government is administering 20,000,000 acres of her forest domain? If for no other reason California can afford to support such a board simply to educate her people to the need of co-operating with the Federal officials in their efforts to safeguard their interests in navigation, irrigation, forest material, stock raising, etc.

But there are other more important functions for the State Board of Forestry.

Many thousands of acres of the best timber in the State is held by private parties who are administering their holdings for private gain regardless of public good. The existence of the Board of Forestry places within the reach of these owners technical knowledge as to how they can manage their properties without seriously curtailing their

Hoarding Money

is popular now.

Many have become so conservative that no security is good enough to induce them to part with their funds.

When conditions return to normal much of this hoarded money will be brought out and invested. The opportunity will then be gone to take advantage of the low prices.

Sound securities are safer now than they were when selling at high prices. They yield better interest returns and present an exceptional opportunity for additional profit through advance in price.

Our six per cent coupon mortgages are first liens upon improved city property, and are exceptionally well secured. Intending purchasers may view this security and confirm our estimate of its value. These mortgages are as convertible as Savings Banks deposits, and pay six per cent per annum quarterly interest.

We invite a call or correspondence from those in need of safe and conservative bond or mortgage investments.

With the Citrus Growers

LEMON MEN'S CLUB.

THE Lemon Mens' Club met at the Chamber of Commerce in Los Angeles Nov. 30th and discussed crop prospects and latest developments in handling the product.

Coloring or curing lemons by confining in air-tight and ventilated rooms with carbon dioxide or burnt out air, had not proven to give definite results.

Mr. C. C. Teague said that while in New York city recently, he noticed that many consignments of imported lemons appeared to be of fine quality, but the pack was uneven, many different sizes being in a box. Though apparently of good quality, they did not bring the price of California lemons.

The members reported that there was promise of an increase in the crop of from 15 to 20 per cent over that of the present season, ranging from 10 to 25 per cent in different localities.

STORY OF THE ORANGE.

From the Salt Lake booklet mentioned last week, we note regarding the Washington navel:

While the introduction of the navel orange has been extensively written up, there undoubtedly will be many readers of this article who are not familiar with the case. The following data was furnished by the department wardens at Washington, D. C., and is of the data furnished by Mr. Saunders, the gardener:

James Hogg of New York stated in 1888 that in 1838 he left Brazil, where he had been a wealthy planter, and settled in Florida. Before leaving Brazil he secured several plants for introduction into Florida, among which were several navel orange trees. In the Seminole war the entire collection was destroyed by the U. S. troops for the reason that the owner had given aid to the enemy. It is not positively known that these trees were of the same variety as those introduced from Bahia, but it seems probable that this was the case. None of these trees came into fruiting, and no trace of them now exists. In 1868 William Saunders, superintendent of the gardens and grounds of the United States Department of Agriculture, learned through a correspondent then in Bahia, Brazil, that the oranges there were of a character superior to any known in the United States. The department accordingly ordered a small shipment of trees. The first lot was found dead upon arrival, but by sending more minute directions as to budding, packing and shipping, twelve small trees in fairly good condition were received by the department in 1870. These were planted in one of the gardens, and propagated from by budding on small orange stock.

The young trees thus propagated were distributed to orange growers in California and Florida, under the name of Bahia, for testing. In 1873 two of these trees propagated from those originally from Brazil were sent to L. C. Tibbets of Riverside, Cal. When they came into bearing, the superiority of the fruit to other varieties then grown in California was quickly recognized, and the trees of Mr. Tibbets were largely propagated from by the California nurseries. One of these nursery men named the variety the Riverside Navel, and claimed to have imported the trees from Brazil him-

self. Later at a conference of orange growers held at Los Angeles, the name of Washington Navel was adopted for the variety, under which name it has been grown generally. The American Pomological Society, however, still adheres to the name "Bahia," under which Mr. Saunders introduced it, and recognizes the names Riverside Navel and Washington navel as synonymous.

Records state that about the time the Washington Navel trees were received by Mr. Tibbets, some were sent to Alexander Crow of Southern California. As the Riverside trees were first to fruit, those sent to Mr. Crow were not considered in the propagation and cultivation of the Washington Navel in this section, and regarding the introduction, this is the correct story:

Early in 1873 Mrs. Tibbets was in Washington just prior to going to her new home in Riverside, Cal. Mr. Saunders offered to give her some samples of this new and untried orange, and she gladly accepted two trees. Of the trees of this variety sent to Florida, some good fruit was produced; but they did not bear enough to pay; and this has given rise to the idea that there was more than one variety in the lot of trees which came from Brazil. But it is now generally conceded that the difference in the fruitfulness came from the better climatic conditions that existed in Southern California. Of the Bahia in its native State the author has been informed that did the Bahia section produce oranges that could be shipped, no other section in the world could hope to compete with them for quality. The navel is grown there in almost a wild state, and when ripe will last only a few days after being picked. The skin is much thinner than that of the California navel, and by breaking it open it is possible to remove the skin from the orange almost in its entirety. If one end of the orange was then cut off, it could be taken in the hand and all the juice squeezed out without so much as wetting the hand. The pulp when eaten has a mushy consistency, and the flavor of the orange is much more delicious than that of our oranges.

In September, 1889, the Department of State, through Alvey A. Ade, acting secretary, sent a circular letter to the consular officers of the United States. This circular letter was sent at the request of the California State Board of Horticulture, and enclosed a series of questions relative to the cultivation of oranges, lemons, figs and olives. D. N. Burke, consul at Bahia, Brazil, reported some of the following pertinent facts regarding the culture of oranges in that place: Oranges grown there were all used in the place, none being exported to even adjoining states. The supply was so limited as practically to prohibit exportation, and it was practically impossible on account of the high price that was charged for them. They would cost there more than \$6 a hundred. Among the varieties given was the navel orange, and it was also stated that they grew to a good size and had a delicious flavor. The fruit was very heavy and often measured eighteen to twenty inches in circumference, while the ordinary size is from twelve to fifteen inches in circumference. The consul also reported that the Seytle orange, which has rather a bitter taste, and

the tangerine and wild orange also are grown there. These three varieties all have seeds.

No cultivating of groves was done, except where grass and weeds were kept away with a large hoe. Neither did they irrigate. As their rainy season begins about April 1 and continues till November 1, and the fruit is picked from May to August, it usually ripens in the rainy season. It is stated that trees are propagated by cuttings in California. Orchards generally are very small. People there will buy oranges only when fully ripened.

In California the growing of the gold-

honest effort as any branch of horticultural work in which a man may engage. Coupled with the benefits and comforts to be derived from living under almost perfect climatic conditions, it makes life here one long happy holiday; for a few years' work and saving will place one in a position to be comparatively independent. Dame Nature has done much for us, and here she surely smiles with an audible chuckle at everyone who will half try for the hundred-fold returns we are continually getting. Surely, this is the Garden of the Gods, the Land of the Golden Apple, where

Courtesy Salt Lake Route

apple, with the many varieties of citrus fruits, nearly all of which undoubtedly had their origin in the Malay Archipelago, is so firmly established that without danger of contraction it can be affirmed that the growing and propagating of citrus fruits has reached a higher stage of development than the growing of any other fruit in the world. Compared with other fruits in America, according to the time since orange growing on a commercial basis began, there is more money invested in growing and marketing of the orange and lemon than in all other fruits combined; for the freight and icing charges alone from California amount to about fifteen millions of dollars annually.

* * *

While it is taken for granted that the business of producing oranges may attract a few just for the sake of "owning a grove," there are many (and some early) arrivals who are heard to remark, "I understand an orange grove does not pay." growing citrus fruits, as in any other industry in which a man may engage, the individual himself is the most potent factor in the success of the enterprise; the personal factor, the most important element in making the difference between profit and loss. The successful grower must bring to his work a thorough knowledge of every phase of the industry, backed by a fixed determination to succeed in spite of all difficulties.

The cry of "over-supply" constantly being dinned into our ears, and has been the last twenty years. But the time has not yet arrived, and appears still to be far in the future; for the whole, the growing of citrus fruits offers as good inducements for

the vine and fig tree also are in evidence.

Men who have made a decided success of orange growing have demonstrated that it is necessary to put a large amount of study into the handling of their orchards. Where can one find a business man (and the successful farmer of today is a business man) who would think of investing \$5000 to \$20,000 in a business and then expect it to run itself and net him twenty per cent. per annum on his investment without the expenditure of money for labor or maintenance? That is just what many purchasers of orange groves have done.

ORANGES IN FLORIDA

C. J. K. Jones, now in Los Angeles Public Library, but formerly a large orange orchardist in Florida, sends us this item from a letter from a Florida grower:

This friend writes, "There is quite a good crop of oranges all through this section (De Land) and prices are out of sight as you will see from the enclosed letter. 'We sold our crop today, clipping from catalogue enclosed, at \$6.25 to \$7.00; highest of the season. This was for very beautiful, heavy, solid grape fruit.' Let it come right along. We have quite a nice little crop ourselves, and are very busy shipping it (oranges). It is very early this year, and of fine quality. We have not sold a box for less than \$6.00, so for once, perhaps, we shall make a little something."

The young fellow who leaves his buggy top down and crumpled, and throws his hat in the corner of the room and hangs his best suit on the closet floor has a pretty good start for traveling the back alley road of life.

MORE FRUIT WITH LESS LABOR

You can positively insure a larger crop, clean fruit and healthy trees at a saving of fully one-third the labor ordinarily required and with a much less outlay of time and money by using a Bean Magic Spray Pump. The reason is because it sprays thoroughly with high, even pressure, but the operator is working against only one-half the pressure indicated on the gauge. It's on account of the spring which makes the Magic Spray Pump the easiest running, most perfect spray pump ever made. No other pump can compete with it in the essential points of quality and durability, and we challenge comparison with all other makes regardless of price or construction.

Bean Magic Spray Pumps

are the result of careful study and experience in pump manufacture. We have no other line. We are specialists in pump-making, and the name BEAN on a spray pump or appliance is a guarantee that it is the best that money and brains can produce.

The most successful raisers of fancy fruit agree that spraying is the only and most effective method of securing the best results. The increase in profit from securing fancy fruit will alone soon pay for the outfit. Whether you have a large or small orchard you cannot afford to be without a Bean Magic Pump.

We have samples of these Pumps in stock, and will be pleased to show them to you.

COW PRODUCTS.

individuality in the Cow.

DIFFERENCE in the quality of her products confront the dairyman. Milk not too rich, is the present fad, one that carries less fat and less solids than the old requirements. This lighter or more watery milk is sought by asylums, reformatories and hospitals. The claim being that it is more digestible. In certified milk it is more desirable, as it requires less modification to fit it for the food of invalids and babies. The breeders of dairy animals are trying to fall into line with these requirements. The selling of fresh milk has been more profitable than butter or cheese making. Now, however, the high prices of labor has brought the profits down on fresh milk. The health ordinances of the cities are greatly increasing the expense of the milkman. The ordinary milkers will not assume the extra cleaning required about the stables and cows. Every fifty cows requires an extra man, half the time, to clean the stables.

Condensed Milk.

This has always been a clean product. The milk used must be good and free from taints before the condensary will receive it. I was told the other day by a large Eastern jobber, that the sales of condensed milk were greatly increasing in Cleveland. In families of adults milk is often only used in half quantities now-a-days. This is natural, for the great increase in wages has been among the mechanics. The salaried people, clerks, bookkeepers and teachers are having to reduce their table expenses, as the increase has not been great in their earnings.

Breeds of Cattle.

The breeds of dairy stock are growing more nearly alike in their products instead of wider apart. The breeders of the cows giving high per cent milk are now breeding to increase the quantity. The breeders of the skim milk type are breeding to build up the butter fat contents. How well this has been done in late years we see in a record of a cow like Colantha 4th's Johanna. In ten months this cow has produced 23,981.4 pounds of milk, containing 875.7 pounds of butter fat. She is, now, after ten months, giving 65 pounds of milk testing 4 per cent or over of butter fat. This is done by one cow! How is it made possible for one animal to exceed all others around her? Constitution in the cow and brain in the owner. It was Sir Reynolds that replied, when asked, in what medium he mixed his color to obtain their wondrous beauty. "Brains, sir, brains!"

Brains for the Dairyman.

Education is freely offered to the farmer by the government and experiment stations. Did you ever consider that applied brains had lifted farming out of the laboring class to a profession? Farming today has the fascination of a profession. It also has free outdoor life full of pleasure that makes it an ever fresh joy to be alive. Plodding after a plow without thought had brought the products of the soil below cost of production in many of the Eastern

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

States. A man that was used to thinking, a minister, took the land of the poorest type and on fifteen acres soon grew all the rough food for seventeen head of animals. He applied brains, and found farming profitable. I trust all are familiar with the record of Dr. Dietrich's Pennsylvania farm. If not, read it up in the Government Bulletin. The same results have been obtained by him on a larger farm. He has chosen the way to bring back the worn out soils to full production.

Experiment Station Work.

Many of the farmers with brains go to experimenting, not farming. The difference between experiment station work and the farm work is in this: The farmer should only take up plans that have a fifty per cent chance of success. These plans should be formed by watching nature and using the best of her tendencies. Selecting the best always as parent of animals, trees or vines and discarding the poorer specimens. The stations are trying a little of everything, and having the records of failures tabulated for the farmer. I find the things they have found not worth doing greater helps often than the things they suggest as good. It is like having a stake in the hole in the ice, one does not get a ducking by falling in the water.

Casein Test.

The Babcock test has given the butter maker a machine that brings his work down to exactness; he knows how much butter he will have when the churn stops its revolutions. Now the cheese maker has the promise of a new machine to find out the casein in the milk as he buys it. This new machine is said to be simple as the Babcock test in its workings. The testing of the casein could, of course, always be made in the slow, laboratory way, the same way as the butter fat was determined by the earlier test. This could not be done by any one with an ordinary education, it was too much for him. Now the matter is as easy as making the cheese. It will enable the cheese-maker to select the milk he needs intelligently.—M. E. Sherman.

A CONCRETE WATER TROUGH.

If you keep much stock, and especially if it runs in a pasture, a water trough is a necessity. When made of wood they decay and leak and are generally unsatisfactory. A contributor to the Progressive Farmer tells how he made one at small cost which will last several generations, being almost indestructible. In most parts of this State it could not be made exactly according to his directions for lack of broken stone. Where obtainable, oyster shell would answer very well as a substitute. However, the trough could be made from cement and sand, without either rock or shell, but would, of course, cost more, as it would take more cement. The directions are as follows:

Nearly every farmer has to have some sort of a water trough. Some will construct them of plank, others will chop out a log, while a few will take the horses to a mud hole and avoid all trouble. Now, if you have never used a concrete water trough,

Warranted to give satisfaction.

GOMBAULT'S CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is warranted to give satisfaction. Price \$1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

Saves Hours of Cleaning

Of course your wife would try to wash even the worst cream separator bowl properly twice every day. But why ask her to slave over a heavy, complicated "bucket bowl," like either

of the four on the left? Why not save her hours of cleaning every week by getting a Sharples Dairy Tubular Cream Separator with a simple, light, Tubular bowl, easily cleaned in 3 minutes, like that on the right? It holds the world's record for clean skimming.

Sharples Tubular Cream Separators are different—very different—from all others. Every difference is to your advantage. Write for catalog M-290 and valuable free book "Business Dairying."

The Whole Truth In A Nut Shell

It's "Reliable"

And RELIABILITY is "THE quality of qualities." A reputation for RELIABILITY is not won in a day, a month or a year. Consistent performance during the slow testing of time, alone is sufficient to prove that most satisfactory of qualities—RELIABILITY. Each year for past sixteen years, the

U.S. CREAM SEPARATOR

has been adding to its reputation for RELIABILITY which is UNEQUALLED today. Dairymen today choose the U. S. because they KNOW it can be depended upon to do the Best work ALL the time and the Longest time, too. Time has PROVED it.

Mr. Van Worm's few words sum up completely the many reasons why dairymen everywhere are fast exchanging their old style, unsatisfactory or "cheap" separators for the RELIABLE, clean skimming, up-to-date U. S. If you have one of "the other kind," WE'VE a proposition to make you. Just ask us about it, please.

The thirty illustrations in our new catalog enable you to easily SEE why the construction of the U. S. makes it the most RELIABLE and profitable. Won't you send today for free copy? Just ask for "No. 20."

you don't know what a great improvement it is over other sorts. But you say at once, "That's all right for the fancy farmer, but I have to make my living farming." Well, so do I. And that is exactly why I can't be forever doing things over and over; must have time to work at farming.

However, a cement water trough is not as expensive as it looks by a good deal. That solid substantial appearance and everlasting quality are two of the things the farmer can get with a very small outlay of cash when he once knows how to do the work.

Here is how we made ours four years ago this fall. We had about half a load of good coarse creek sand left over from another job we had been at. The man was hauling rock again that day so we had him to dump a cart load near where we wanted our trough to be. We fixed up a mortar box three feet by four, put in this two buckets of sand and one of best Portland cement, then more sand and cement, until there was about six bushels of the pile. We then shoveled this over four times so the sand and cement was very thoroughly mixed. The next move was to make two boxes 24 inches high—one three feet by seven feet, the other two feet by six feet—both inside measure. Neither box had any bottom. The first was set right on top of the ground where we wished our trough to be located and the other set inside of the first, so there was a six-inch space all around between the two boxes. Now we sprinkled about a bushel of the cement and sand so it was wet, but not dripping, mixing it well while sprinkling. Spread this between the two boxes, then pounded down all the rocks into the cement that we could and still have the concrete cover all. This made about six inches deep of concrete in our space.

We then got an old piece of one-half inch iron rod, about twenty feet long, bent it the shape our trough was to be and laid it in on top of the concrete already in; mixed some more concrete, dumped it in, pounded in more rock until the space was full to the top of the boxes. We went to shucking corn then and forgot all about the water trough, except that we sprinkled it once in a while when passing that way with the water bucket. After about four days we took out the inside box (made so it would come apart,) dumped a couple of bushels of wet cement in the bottom of the enclosure, pounded in a lot more rock, troweled off the entire inside smooth, and our trough was done at a cost of \$2.80 cash and one hour and forty minutes' time.

We turned the water in after three days, and it has been in use ever since. We left the outer box in place for about two weeks so the stock would not disturb the concrete until it was thoroughly hard. Try one of them.

WE SELL THEM.

The Oliver Plows have merit that's true, Have points of good value that bear weight with you; They turn up the earth in a wonderful manner— And in the Plow march they carry the banner! See Page 618.

Deciduous Fruit Culture

FARMERS' INSTITUTES.

At Banning it was shown by the pear and prune orchards, that conditions there are particularly favorable for these fruits. Bartlett pears, which have had slight attacks of blight for five or six years, are comparatively free and are, without doubt, the best paying crop for that section. The dry atmosphere and slow growth of the trees discouraged the spread of the blight. It seldom infests limbs larger than a lead pencil and many trees show no signs of the disease; in fact, the majority do not. Part of one orchard has alfalfa planted solid up to the trees. These are irrigated by the overflow from the furrows. These trees are much larger than any other in the orchard, and produce twice as much fruit. Twelve-year-old trees producing ten tons per acre.

Peach blight has scarcely made its appearance, but the disease affecting all deciduous fruits were discussed and the growers are on the alert. Irrigation and care of deciduous orchards were discussed by growers, giving the methods best adapted for local conditions.

Coachella.

At Coachella, grape culture is of much importance. The extra large size of the vines attained during the first year renders the second pruning

an operation entirely different from that practiced in the older grape-growing sections of the State. At the end of the second summer, the vines have attained the size and bearing capacity of an ordinary four-year-old vine. We advised that the vines be so pruned, and demonstrations were made in the hall on vines provided for exhibition. After having been pruned, twenty-months-old vines had the dimension of four-year-old vines as grown in the Sacramento and San Joaquin valleys.

So far in the history of grape growing in the desert region, the vines have been allowed to take care of themselves, no experiments having been made in training on stakes or trellis. The latter was recommended as superior to any other method for varieties that require long pruning. The advantages of the trellis over the stake are, the bunches of grapes hang independent and free from contact with canes, leaves, stakes or branches. They hang free and independent of everything. The heavy winds do not wrench and twist the vines, but instead, they swing on the vines as though hinged to it. The most severe winds will not break the vines or injure the fruit. Last, but not least, the vines on trellis will bear about twice as much fruit of superior quality as those tied up to stakes.

The chief disadvantage of the stake, is the rigid and unyielding grip that is maintained on the canes. This permits the strong vines to tear off many leaves and bruises many of the remaining ones. Should the twine holding the vines to the stakes break, the grapes on them are almost sure to be a total loss. This is particularly true of Thompson's seedless. There is always a heavy loss of fruit at picking time, because the bunches grow around the canes and a general tangle is the result.

Brawley.

At Brawley, apricot and grape growing promise great things. The same rules for prunes and training the grape apply all through the Imperial valley as far as known. The apricot is handled to advantage when pruned as when grown in the older apricot growing districts of the State. The trees make a much ranker growth than in other parts of the State, and while a tree of three years is as large as an ordinary four-year-old, it requires the same pruning to bring it down to the proper height and give it strength to maintain a full crop.

These main facts were brought out at all the Imperial valley points.

SHOULD BE IN EVERY HOME.

Mr. J. E. Schofield, of Parlier, says "the Cultivator is a good paper and should be in the home of every rancher in the State. There are many things he can learn from its pages without which he would learn only by experience."

ENGLISH WALNUTS MAKE FORTUNES.

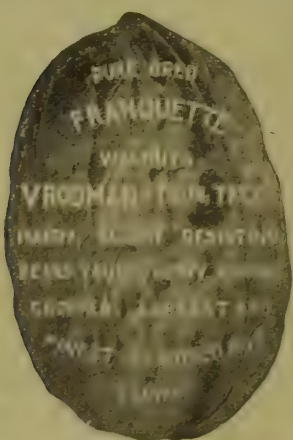

From forty acres of lowlands in Yamhill county, a Massachusetts steel manufacturer who went into English walnut growing as a diversion, is making a fortune. Thomas Prince of Worcester, Mass., who spends a part of every year in Oregon, is the man who discovered the anomalous fact that French trees in American soil produces the best "English" walnuts. He is now planting 30 acres of walnut trees in addition to the 40 already at the productive stage, and 100 acres coming into bearing.

One of the Prince trees produces 125 pounds of nuts for which he receives 18 cents a pound.

Eight hundred acres in the same county are already planted in English walnut trees. French trees sometimes bear as long as 300 years.

THE CENTURY IN 1908.

The fascinating problem of the possible—Professor Lowell says the certain—existence of life on Mars today, is to be discussed fully, authoritatively, yet so that the general reader lacking in scientific training may understand and enjoy, in the new volume of The Century. In his discussion of "Mars as a Possible Abode of Life"—papers based upon this very successful popular lectures delivered last winter before the Lowell Institute, Boston, Professor Lowell will present the most important latest astronomical discoveries and theories; and the illustrations will include reproductions from photographs of the planet, taken under unusually favorable circumstances during the sum-

LET US EXPLAIN

to you the difference between the PURE BRED FRANQUETTE WALNUT—as shown on the border of this Ad—and the ordinary English walnut. When you buy walnut trees, BE POSITIVE WHAT YOU ARE GETTING. Guessing is uncertain and often expensive.

Our walnuts for seed purposes and our scions for grafting purposes are all secured from Mrs. E. M. Vrooman's famous GRAFTED FRANQUETTE WALNUT grove of Santa Rosa, California. Her grove contains

ONE THOUSAND TREES---ALL GRAFTED

the only large bearing FRANQUETTE grove of "ALL GRAFTED TREES" in the world. Write for our FREE BOOKLET describing this "King of Walnut Groves" and its record.

When you buy trees that are descendants of this grove you make no mistake. We guarantee our trees to be Pure Franquettes.

We cannot tell you much in this small space, but let us write you direct. The Pacific slope—(generally speaking)—is adapted to Walnut culture and is destined to become the center of this profitable branch of horticulture. Why not start now? Address,

Lentils.

Please let me know where I can buy Lentils, as I wish them for planting.—J. Z., Palo Verde, Cal.

Any seed firm advertising in the Cultivator can supply these seeds.

Orange Seed.

Where can I purchase orange seed from which to start a seed bed this coming spring?—D. G., Anaheim, Cal.

We imagine the seed firms advertising in the Cultivator can secure you these seed, or we think that you can readily secure them by going to the packing houses in your section at the time of shipping seedling oranges next spring and secure the culled fruit which you can rot down and wash out your own seed. Should you wish Florida Sour Stock or Trifoliata it will be necessary to get in touch with the seedmen.

Franquette Grafts.

Will you please tell me through the Cultivator where I can secure grafts of the Franquette walnut.—A Subscriber, Orland.

There are several orchards of this variety of walnut in the northern part of the State, one of which is in Woodland and which we recently mentioned as having done very well for its owner. We do not now recall the name of this owner, but by writing nearly any nurseryman in the north, some of whom are advertising in the Cultivator, we think you will be able to get these grafts.

Law of Planting Near Line.

Will you please inform the readers of the Cultivator, what the law is of planting eucalyptus trees near the boundary line.—W. A. B., Perry.

We believe there is no law touching that particular point either as to eucalyptus or other trees, but, of course, if any tree is planted which becomes a nuisance it can be removed. If planted directly on the line then it is property of both and may not be removed without the consent of both. Where trees planted on one place encroaches on other land the owner of the latter may cut such roots or any portion of the top which projects on his land, but ordinarily cannot compel removal while on the other land.

FORESTRY.

Continued from First Page

profits and without being the cause of public calamities. The State is vitally interested in the way this natural resource is exploited, and if its owners do not prove themselves amenable to the demands of the public good, laws should be enacted to compel them to do it.

Another direction for the activities of the Board of Forestry, which should be of immense benefit to the State, is opened by the thrifty growth here of eucalyptus. The great, unanswerable objection to the practice of forestry by individuals arises from the time element involved between the planting and the harvesting of forest crops. Fortunately for Cali-

fornia this objection does not apply to this remarkable genus. There is need for the establishment of an eucalyptus plantation on every California farm, to supply wood, posts, poles and all the thousand uses for which wood is required. I shall not go into detail here to tell you of the methods of propagation or the profits it is possible to secure, but I want to assure you that the Board of Forestry is in a position to help every planter who means business and will meet him half way.

Then there is the fire problem, rendered so vast by the extreme drought of our summers. Fortunately we have good laws to punish those who are careless with fires and the existence of over 600 voluntary fire wardens in the State proves the public is vitally interested in their enforcement. Gradually we are learning to think twice before starting fires though old customs sometimes prevail. Thanks to the efforts of the fire wardens the Board of Forestry has justified its existence many times over by its activities under the laws relating to forest fires. And it will continue to do so until the belief in forestry will be so strong in the State that a popular demand will come for the establishment of a college of forestry at the University of California. This action should be taken and I believe it will be in the not distant future.

IT PAYS TO FERTILIZE

One hundred pounds of grapes to the vine seems like an extremely high average, but it is claimed for the Tom Lewis Fertilizer that that is exactly what it did on the Rus. Stevens's ranch at Sacramento. Rus. Stevens is known to produce exceedingly fine grapes and he knows where to get fine fertilizer. Nor is he the only one for Mr. Lewis says that he can produce testimonials from hundreds of others equally as good.

A farmer at Newcastle, California, writes that he tried it side by side with another fertilizer for which great claims have been made, and found the Tom Lewis to produce the best results.

THE POMONA POWER HEADS

The Pomona Manufacturing Company is out with a 40-page catalogue and price list of its power heads, cylinders and parts. This company has been manufacturing these pumps for a great many years, and the business has so greatly increased that the company is pushed to its limit to meet all the demands made upon it. Many pleased people who have used these pumps have found them so economical both as to fuel consumption and as to repair expense, that they have passed the word along to their friends which has caused the increase in business noted.

Any interested irrigator who may wish the information contained in the book, or wishes to know anything about the pump can write at once to the Pomona Manufacturing Company and secure this booklet.

The El Centro Melon Growers' Association has already signed up 400 acres and expects to produce a total next season of 600 acres. The officers are: John Norton, president; W. R. Waldrop, vice-president; W. S. Ballard secretary; J. A. McCause, W. A. Thayer.

If you have not seen the poultry essay contest adv., write the Success (no lamp) Incubator Co. of White Salmon, Wash., and get a list of the premiums.

The Ornamental Garden

LEARNING BY LOOKING.

A WRITER in the Country Gentleman recently gave a few notes on observing the surroundings of tasty homes and shaping our ideas of our own home surroundings. From them we quote:

When the city man who was about to establish a new home in the country, asked advice of a farmer about the location of his buildings and various other details, the latter offered to take him for a drive of 10 or 15 miles through the country. "You will get more suggestions as to what to do and what not to do in a few hours than I could give you in a week," he said. The city man's farm had an orchard and a few old buildings, but he was planning to erect a comfortable house and good barn, using the small buildings for cribs, wood house, chicken houses and pig pens for the present.

Save an Outlook.

They drove slowly, and as they passed the first farm, the city man said he did not like the orchard cutting off the view from the road. It was planted on both sides of the house and completely shut off all but a narrow tunnel of view of the highway. A great deal of the complaint about the loneliness of country life would be done away if more farmers placed their dwellings where the women could have a good view of the road from the sitting-room windows. To be tucked back behind an orchard is not pleasant, though shade trees on the lawn are desirable.

The next house had the wood house placed on the north side of the house, while the driveway was at the south. The wood had to be hauled over the lawn in order to reach the unhandy house that a few hours' work would have placed in a good position. By this time the city man had his note-book out and was jotting down items. The orchard at this place was close to the house, but back, not to tempt passing thieves, and was used as a poultry yard. A high poultry fence kept the fowls off the lawn and out of the garden, which was also close to the house. The barn was at a convenient distance from the dwelling, with the yard back of it.

A Little Better.

Presently they came to a dwelling that seemed ideal—trees hanging protectingly over the house, a wide, smooth lawn, barn well back and yet convenient, and a fine orchard that did not obstruct the view. The trees on the lawn were so large that one could see down to the road without difficulty, and the city man was in raptures. He determined to put his new house right in the thick clump of forest trees on the front of his place and move every other building, if necessary, in order to get the effect of the house before his eyes. But his friend cautioned him to look a second time before making up his mind. He called attention to the mossy roof, the sunless house, sunless except when the leaves were off, and to the damp, mossy look of the lawn. Just then out of the house came a thin, sallow woman with a distressing cough, and the city man was astonished to learn that the house was a regular death trap. The owner did not want to cut down the magnificent trees, for he would not believe the damp, sunless house was the cause of the deaths from consumption in the family; so they lingered along year after year in a living death. "Have

all the trees you want, but don't let them cut the sunlight from your house," was the advice of the farmer as they drove on.

The next house stood in the midst of trees, also, but they were well back so as to allow sunshine and fresh air to flood every part. The farmer pointed out that the dining-room and reception hall were to the north, being rooms used the least, while the sitting-room and kitchen had a south exposure. From the bedding airing out of the windows, it was evident that the family sleeping-rooms were also to the south. The barn was a little to the northeast of the house, so that the west winds that prevailed most of the year took away any odor of the stable. The outbuildings for the house were grouped together behind a grapevine trellis and were quite convenient to the kitchen.

Used a Notebook.

The note-book was called upon time and again during the long drive. There were wide, fancy porches at some houses, and nothing at the back door but steps down. All the money had been spent for railings and gingerbread trimmings, so that the back door had to go unprotected. There were pig pens and stables right on the road where they could not help being offensive—often directly across the road from the houses. To have to look out 365 days each year at back yards and piles of fly-breeding manure is enough to discourage any woman. There were vegetable gardens with small fruits in them along the road to tempt the passers-by and vex the soul of the housewife. Along the road is no place for the garden anyway. No woman likes to go out in an old dress to weed a little while in full view of every one who goes past.

So the city man obtained enough new ideas that morning to set him thinking and rearranging his plans. In time his new home appeared with the fine forest trees left for a grove, but not to shelter the house, the outbuildings grouped where they would be handy but not conspicuous, the living-rooms on the sunny side, the back porch more complete than the front, and many other little details that go to make up enjoyable living in harmony with the general plan. If more people intending to build or rearrange their premises would learn by keeping their eyes open as they drive through the country, there would be more satisfied country women all over the land.

TREES AND SHRUBS.

Trees and shrubs should be used to conceal unsightly objects in the foreground or in the background, to give the idea of surprise or discovery in passing from one portion of a large estate to another and for the purpose of increasing the apparent length in drives which double back upon themselves in parks and pleasure grounds.

A correspondent says that woven wire about thirty inches wide put around his orchard has kept rabbits out of it ever since he used it.

Such a vast number of peach trees were killed in Michigan last winter that it is estimated that ten years will be required for the State to "make good" again her claims as to peach growing.

The precipitation of the recent rain at Salinas was over one-half inch. Total to date is nearly three inches.

The Vegetable Garden

AN EXPERIMENT WITH CUCUMBERS.

HAVING set a row of posts along the north end of our garden, with the object of making a low fence and at the same time a trellis for grapes, I thought I would try some cucumbers on the south side of this fence by allowing them to run up on the trellis, so that the pickles could be gathered from the under side. The posts were seven feet above ground and boards were nailed on to a height of three feet from the ground. At a distance of seven feet from this fence, short stakes made of 2x3 redwood, and about two feet long were driven into the ground allowing the stakes to extend about 12 inches above the ground and care taken that the row was straight and parallel with the fence. Along the top of the stakes on the outside a board six inches wide was nailed the entire length. The posts of the fence and the stakes were eight feet apart and exactly opposite each other. A strip of 1x4 was nailed from

tion should be had in both irrigation and cultivation. The soil should have been thoroughly cultivated after every watering, and it was just as necessary that the picking be done every day. From the free way the vines climbed this trellis and the secure hold the tendrils made around the wires, I feel confident they would climb a perpendicular trellis, if assisted in the start. While I would hesitate to pursue this method on a large scale, I would surely follow it where space was limited. I think it would be especially valuable when growing cucumbers for slicing.

I formerly grew large quantities of cucumbers for the pickle market, some times sending in five tons in a single day, but one of the chief difficulties encountered was the injury to the vines by the pickers tramping and bruising them, in their efforts to get at the fruit. This injury caused defective fruit and shortened the life of the vines. The trellis system would obviate this.

The row of plants illustrated in the

Under Side of Trellis
Trellising Cucumbers at Mr. Lobingier's Ranch

Vines Climbing Over Wires

the top of each post to the top of each stake.

Common telephone wire was stretched along on top of these stakes the entire length of the frame beginning about four inches from the top of stakes and placing a wire out every eight inches until the entire frame was covered. The engraving will make the construction of this work clear.

The soil was well prepared, and cucumber seed planted along the outside of the frame every three feet the last week in June. Later the plants were thinned to two and occasionally three plants. The branches that did not seem inclined to grow up on to the trellis were assisted by tying loosely in the proper direction. However, they quickly threw out tendrils and fastened themselves to the wires so only that I think it would have been a cyclone to have dislodged them.

Unfortunately, for the financial results of this experiment, the writer was taken ill, away from home, just when the vines began to bear, and was unable to return to the ranch for weeks. For a time the folks at home endeavored to gather them daily, but the press of other more important work made it impossible to give them further attention and they were left to themselves.

I should explain that it was intended to dispose of the product as small pickles and what were gathered were packed down in barrels in salt and sold to the pickle factory. Four barrels were gathered before the work was abandoned, which sold for \$5.00 a barrel—the factory furnishing the salt and the salt.

For the best success, careful atten-

tion engraving is 300 feet long and if the plants had been started early in May instead of the last week in June, and could have had proper attention throughout the season, I think the product would have sold for about \$100 either as pickles or cucumbers. The variety was Nicholi, medium green.

Both photographs were taken some time after the picking had been abandoned. The engraving on the left will show how the fruit hung from the under side.—Q. A. L.

THREE CROPS IN A YEAR.

In warm and sheltered parts of California potatoes may be planted the very first days of January. In order to be successful a rich, loamy soil is necessary. There must be present an abundance of humus. The soil cannot easily be too rich at a time of the year when it is cool, and nitrification is necessarily slow. The tubers should not be covered deeper than three inches. If planted deeper, they will be too far down in the ground to receive the beneficial warmth of the sun's rays. In that case they will be slow in coming up and the tubers will be smaller and mature later and will, consequently, prove unprofitable. Potatoes planted as early as here indicated do best in dry winters when there is plenty of sunshine. Then there will be fair returns even if the soil is not extra fertile; while with a great deal of rain an abundance of humus must be present on account of the cold and the leaching by too much rain. Do not resort to deep plowing as that will destroy capillary attraction, a thing that is much needed in a dry season. When the tubers are beginning to size up well, go along with an ordinary hoe; throw one hoe of earth on each hill preferably from the sunside which will draw the top over and let in heat on the hill, a thing essential at this time of the year. This work can be done about as fast as one can walk, and costs

but little. Aside from this, flat cultivation is in order. A crop grown in this way can be grown and harvested about the middle of April, and the land planted to some ninety-day crop, which can be harvested in August, after which peas can be planted and harvested before the holidays, thus making three full crops off the same piece of ground in one year. But do not be fool enough to think that this can be done everlastingly without adding to the soil. For variety of potatoes use the northern grown Early Rose, if possible. It is best to get them just as the sprouts are starting. Avoid those that have

the sprouts broken off. If the sprouts are not yet started put them in a good warm room, use artificial heat if need be; keep warm day and night and you will see them sprouting in a very few days. Don't plant until they are well sprouted. If sprouting to rapidly, remove to a cool place. Plant whole tubers if not larger than a hen's egg; use none smaller than a good-sized walnut. When cutting do not make the pieces too small. Leave at least two eyes to a piece. Spray with Bordeaux mixture when the tops are not yet quite full grown. Neglecting this may be the cause of total failure.—J. C. Ostergard.

Grounds, 1 Mile S. E. of Mission

San Gabriel, Cal

It is not boasting, but simply stating a fact when we say we have had the largest return from strawberries the past season that has ever been recorded. We consider the quality of the plants we used one of the important factors in obtaining this result. Our plants are grown with all the skill and care that forty years' experience can suggest. Write us for leaflet telling how. The Brandywine is the only variety we grow. Plants ready for shipment January 1st, and we do not think it possible to produce better stock that we offer. Intending purchasers cordially invited to inspect our grounds.

Newbert's Phenomenal Berry

The World's Wonder

It will make you more profit to the acre than any berry that grows. \$1400 actual profit has been made from one acre of this most wonderful berry. It is the largest berry that grows, a bright, rosy red and a great shipper. For pies, jams, jellies, etc., it has no equal. I grow no others. You can make no mistake by buying of me.

PACKING FOR PROFIT.

Our attention was directed recently to "A Plea for Honest Packing," by a correspondent in the Florida Agriculturist.

The writer takes the position that there is very much more in careful packing than most people think, as fruit sells as much from its attractiveness as from its worth. The Cultivator has also advocated attractive packing, yet honest packing. The custom of putting the top-off row of berries or fruit of any kind, the best in the box and filling below with imperfect fruit, has proven unpopular, and a losing financial stroke for every seller who has practiced the plan. The scheme is dishonest, in the first place, and must result in damage to the reputation of the seller.

We all soon learn to discredit and avoid certain lines of berries, or certain brands of fruit, just because the packers have the reputation of making dishonest packs; of putting good fruit on top and poor fruit below. As a business proposition it pays to be honest in selecting and packing fruit of all kinds.

The writer of the article spoken of in the Agriculturist says he "well remembers when in the berry business in a distant State, many years ago, that most of the commission men advised topping out the boxes of strawberries by setting some of the largest fruit with the nose up and the stems hidden. This made considerable extra work, and the customers all knowing they were buying topped fruit paid accordingly, while fruit not topped out was almost a drug on the market, the purchaser reasoning that if the top was poor the bottom must be poorer, and therefore they brought poor prices, so the honest shipper was the loser, while the dishonest shipper was the gainer."

The editor of the Cultivator also remembers a

packer in Iowa who topped off his barrels of apples with beautiful specimens of fruit, but from three to four courses below the top filled in with inferior sorts. For two or three seasons he caught the public, but his scheme being exposed he was actually driven out of the market. His fruit would not sell except on inspection, and the expense of inspection robbed him of his profit. So he went broke.

The dishonest packer, the careless packer, will always lose out in the end, for the public will not stand deception. The old saying that it pays to be honest, applies with significant force to fruit packing.

"In packing fruit of any kind," says the Agriculturist, "an effort should be made to grade as close as possible and if there are several sizes let each be packed separately and marked accordingly, when the number of fruits in the package is required. The writer has in mind two shippers living near each other, who were receiving vastly different prices for what seemed to be the same quality of fruit, and it was all in the grading and neatness of packing.

"An attractive package will do much to sell fruit for a time or two, but if the fruit is not what it ought to be, buyers soon learn to pass it by. There are some shippers who claim that it makes little difference about the fruit if it is put up in an attractive package, while others claim that so long as the fruit is all right the package is of no importance. Both are mistaken. The package should be as attractive as possible to be practicable, and the fruit should be well graded as to size and quality if the shipper expects to create a demand for his fruit other than the casual buyer. If the fruit is so packed, and the shipper advises the firm he consigns to at the time of shipment, the house will have no trouble to place the goods, and after a few consignments every one will bring the top prices. Even a lower grade of fruit well packed will out sell better fruit that is poorly packed. So it pays to be both careful and honest when packing fruit of any kind, for any market."

This advice is worthy to be considered by every packer, everywhere, for a reputation gained by careful packing is a trade mark which will be of lasting value to the person engaged in the fruit industry.

THE INDEPENDENT FARMER.

The financial scare, which, by the way, is waning, afflicted the farmer less seriously than any other person in business at the present time. The farmer was not scared, as was the banker, because he was independent. He had a fine crop the last season which he sold at good figures, and he had paid his debts with its proceeds. His oranges and lemons, his vegetables, his dairy, his poultry and eggs made him good money, and he was so busy putting his land in condition for the coming crops that he had no time to think about a "financial flurry." He had plenty to eat himself and to feed his stock, and what he had to sell brought just as good prices as ever. People have to eat no matter what distress the business world is in, and the man who has something to sell is always sure of an easy road. The railroad managers have to hustle, along with the banks, to provide money and means to move the wheat crop, the corn crop, and any other crop demanded in the markets, while all the farmer has to do is to turn his products into the warehouse, take his check and go home. He doesn't have to worry about a panic; if it comes it hurts the spendthrift, the individual who needs to be taught to mend his ways, to get back to an economical method of living and to stop doing business on a credit system.

The credit system is a bad one anyway. It makes people spendthrifts and it encourages dishonesty. After each panic we become virtuous, for a time; we pay as we go and we are happier for the experience. In '93 we reformed. We ran for a couple of years on a cash basis and we prospered. We cursed and discussed the pernicious credit system, but we drifted back into the old way, and when we were confronted in '97 with another shortage of money we agree that the only proper thing to do is to pay as we go. The business man just now is the fellow who is worried, or he was worried, for his credit was big

and his cash was locked up in the bank vault.

The farmer, however, hasn't fretted any for his wheat, oranges, lemons, hogs, cattle and horses are better than bank stock or clearing house certificates. Ah, the farmer is an enviable fellow in this day of hustle and worry.

LUTHER BURBANK.

The recent visit of Luther Burbank to Southern California was productive of much satisfaction to his many friends and admirers.

His public addresses were instructive, and replete with his simple personality.

Whatever may be said of Luther Burbank, by his critics, the fact remains that he has done, in a modest way, a great deal of scientific work, which is of more than passing value to the country. He is still investigating, propagating and creating new varieties of plants which promise results of inestimable worth to California.

FOR SALE.

A man died and left a million. Every other man who died left that same million. Wherein was the man the richer, inquiries a writer in Farm and Ranch.

It is only money well spent that is saved. Think of this, often.

There is saving to great loss. We do not condemn economy, but do not approve hoarding. Wealth may be commendable. It is desirable. It is often contemptible. How much would Rockefeller give to be respectable? Who would carry his conscience for his wealth? Great thieves may get wealth, but can neither steal nor beg respect of honest men. The respect of some men is for sale, but is not in demand, even by the corrupt.

FARMERS' INSTITUTES.

Conductor Neff announces Farmers' Institutes as follows: Toluca, Jan. 6; Hollywood, Jan. 7; Gardena, January 8.

Shop Talk

Here is something for you to do, which will be of great value to yourself and all the CULTIVATOR readers and a help to the editor. Many people voluntarily write, asking such questions as you see answered under Queries, and which are often very valuable to the general reader. It will be impossible to give a special article devoted to each subject you may mention in answer to this, but the questions are asked with the idea of getting a better understanding of what interests our readers most, and with the desire to give seasonable information on such subjects as pertain to all sections of California.

What department of ranching interests you most?

.....

If fruit, what kinds?.....

If stock, what kinds?.....

On what particular subject would you like more information just now, or in the near future?

.....

Is there a new arrival in your neighborhood who should have the CULTIVATOR? What is his name and address?.....

.....

In what is he interested?.....

Signed

Address

You can appreciate of what value this will be to everyone concerned, so cut it out and mail to us if it appeals to you. Perhaps it is time to remit, and you can do that at the same time.

Address mail to CULTIVATOR PUBLISHING COMPANY, 115½ N. Broadway, Los Angeles, California.

Agricultural Notes of the Pacific Coast

Northern California

Colusa county is exhibiting a 44-pound beet.

After the recent storm at Yreka heavy frosts prevailed.

Horse races is giving zest to life at Anderson this week.

Sacramento river is rising slowly as a result of recent storms.

Anderson is shipping large quantities of cord wood to Sacramento.

Some damage occurred at Willows from the storm which occurred last week.

Ice cutters are busy with their work up in the mountains near Truckee.

Salano county farmers are making a hard kick against the bad roads of that section.

After a thorough inspection of Tehema county sheep they are declared to be free from scab.

There were shipped to Sacramento 71 cars of green apricots this year as against 16 last year.

Northern California shipped ninety-eight cars of cherries this year as against 150 last year.

Tehema county stockmen will try to prevent trespassing on pastures by fencing the larger ranges.

The latest farming attempt in the Sacramento valley is the hatching of alligator eggs near Red Bluff.

The Recorder's office of Siskyou shows great reduction in the number of farm mortgage now on record.

Total shipments of deciduous fruits from the northern part of the State will aggregate to date 7491 cars.

Butte county olives are bringing remarkably good prices this year. The price is ranging from \$40 to \$75 per ton.

Colusa County Horticultural Commission is to open up a stiff fight against the yellow scale infesting orange trees.

Santa Rosa hop growers are organizing to become members of the Central Organization recently formed at Sacramento.

A drainage canal to be constructed near Yuba city will drain a section about 12 by 3 miles and will cost a total of about \$30,000.

Arrests have been made at Woodland of parties charged with starting fires last August, which swept over a number of big stock ranges.

It was rumored at one time that the irrigating canals near Orland were to be purchased by the reclamation service, but no sale has yet occurred.

Colusa county claims she is now growing as fine oranges as the sun ever shone on and calls attention to the exhibit in her Chamber of Commerce for proof of her claim.

The Two Rock Grange has elected the following officers to be installed the first meeting in January: Master, John Schobera; Overseer, Walter Church; Lecturer, Mrs. J. E. Freeman; Secretary, Mrs. Minnie Church; Treasurer, James Carmody; Steward, Byron Punvme; Assistant Steward, A. L. Stice; Ceres, Mrs. Annie Purvine; Pomona, Mrs. Schobera; Flora, Mrs. A. P. Martin; Lady Assistant Steward, Mrs. James Carmody; Organist, Mrs. Jennie Purvine.

Central California

Laton is hoping to have an electric railway.

The rainfall at Watsonville is nearly seven inches to date.

Redwood City is bonding itself for \$30,000 for a new water system.

Watsonville has invented a new spraying machine said to be very economical of handling.

The State Game and Fish Commission realized \$110,000 as a result of resident hunters' licenses.

The greatest scarcity of raisins is said to prevail in eastern retail markets of any time for years.

It is expected that the seeding houses at Fresno will open up full force immediately after the holidays.

Watsonville is holding a meeting in the effort to secure water transportation from that town to the Monterey Bay.

Chairman Sharp of the Horticultural Board of Kings county reports little sign of blight in the peach orchards.

Shortage of seeded raisins is complained of in the eastern markets, which has been caused by long-time transit.

A Watsonville poultry dealer has acquired a new revolving egg cabinet, said to keep eggs for hatching purposes in the best of condition.

Woodchoppers at Watsonville made a killing of 137 snakes in one bunch last week. This has not induced the opening of a temperance campaign as yet.

Some cars of dried fruit which have been shipped from San Joaquin Valley and should have reached Chicago in fourteen days, have been over fifty days in transit.

Many f.o.b. sales of raisins made this season have been rejected on arrival at eastern markets because of some fancied or claimed inferiority of fruit or of pack.

The Pajaronian says: The reforestation of the barren spaces in the Monterey national forest is just now receiving especial attention. Supervisor Torstenson has just shipped to the watershed of the Arroyo Seco 20,000 young pine trees from the government nursery at Santa Barbara. These he will plant on the northern and eastern slopes, along trails, where their growth can be watched and protected.

Orchard City Grange at San Jose has elected officers for the coming term as follows: Master, E. C. Keesling; Overseer, J. Bohnett; Lecturer, P. W. Keith; Steward, Mr. Sholtz; Chaplain, Mrs. Newcomb; Pomona, Mrs. Wilson; Flora, Mrs. Keith; Ceres, Mrs. Hutton; A. S., Mr. Newcomb; L. A. S., Mrs. Sawyer; Secretary, Mrs. Keesling; G. K., Mrs. Foster; Organist, Miss M. Keesling; Trustee, Mr. Whitman.

At the annual meeting of the Fresno Poultry, Pigeon and Pet Stock Association the election of the following officers was made: President, J. F. Forney; vice-presidents, one from each county represented in the association, S. G. Bowen, Fresno; J. C. Naylor, Bakersfield; Elias Gallup, Hanford; Ben Woodhull, Stockton; S. O. Lindgren, Kingsburg; secretary, George R. Andrews; superintendent, R. Uhler; treasurer, A. V. Lisenby.

Southern California

Rainfall at Los Angeles to date 3.43 inches.

Redlands has had about 3½ inches rainfall.

There are 400 pumping plants near Anaheim.

Rainfall at Oxnard to date is nearly five inches.

Coachella Valley is to have a rural free delivery.

Brawley will plant 3000 acres of cantaloupes next year.

A special train of celery is a regular daily feature at Westminster.

San Diego's estimated lemon output for next year will be 900 cars.

Twenty-five hundred acres of beets have already been planted at Oxnard.

Young cabbage plants at Anaheim are looking very thrifty and promise a fine crop.

The recent El Centro horse show is expected to merge into a regular annual horse fair.

Two carloads of dried chilies have been shipped from Anaheim at 10 cents per pound.

Redlands shipped about 125 cars of oranges during one week in the earlier holiday shipments.

One grower of roses in Santa Ana will ship over five carloads of young plants this season.

Buaro, in Orange county, shipped a large number of Christmas strawberries to Los Angeles market.

Beaumont is to have a large reservoir constructed for conserving the water from wells recently sunk.

Experiments with growing onions and cabbage on "salty" land in the Coachella Valley has proven successful.

Another large planting of forest trees is to be made in Mill Creek Canyon, San Bernardino Mountains, by Forest Ranger Allen.

A blacksmith at Tustin has invented a machine for sharpening the disks of plows and harrows which is said to work most satisfactorily.

Los Angeles county is the heaviest lemon shipper of the State. Next year's output is estimated at 1200 carloads, while Riverside is a close second, with 1000 carloads.

The Riverside Press, as a result of an extended canvass as to citrus conditions for the coming year's crop over Southern California, estimates 24,000 cars of oranges and 4500 cars of lemons.

The Mesquite Lake Melon Association has been formed near Brawley. The membership controls about 500 acres of melons, which will be marketed through one concern in New York.

It has been urged that the flow of water from the Colorado River into the Salton Sea shall be permitted to continue sufficient to maintain a large body of water there so as to secure a beneficial influence on the climate of that section.

Mr. C. F. Heil, who recently accompanied a train of celery to the East, has found many uncalled-for delays which he will urge railroads to overcome. The average rate for the entire distance East, including entire stops, was 10.2 miles per hour.

The Coast

An Idaho fruit grower secured \$1100 from five cars of apples.

Big plantings of apples are to be made in Linn county this season.

This has been a banner year for the prune growers at Washington.

Hops in the northwest are looking a trifle less discouraging during the last few days.

Montana is booked for some forty farmers' institutes during January and February.

Oregon claims that Alsike clover is proving to be a great mortgage lifter for that section.

Washington is discussing the advisability of changing its laws regarding irrigating water.

The Idaho State Dairymen's Association will meet in annual convention January 8th to 11th.

The Montana Dairymen's Association held its convention at Great Falls, Montana, December 17th and 18th.

Colorado Agricultural College has held 113 institutes in the last year, at which the total attendance was 19,190.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

PETALUMA POULTRY EXPERIMENT STATION.

A synopsis of investigation made at the Petaluma station are reported in the following:

The equipment of the poultry station has been materially increased during the past year. Sixteen poultry houses, including four different kinds, with substantial wire-fenced yards, have been erected, thus providing greater facilities for carrying on feeding experiments urgently called for by the popular demand for information along this line.

Careful records are being kept of the health, general condition of the fowls and the egg yield from the different yards with a view of practically answering inquiries constantly made with reference to the style of house and mode of ventilation which would prove to be the most profitable for the man of small means.

Among the many inquiries received at the station were questions relative to the comparative feeding value for fowls of wheat and corn. At the present ruling prices there is not much, if any, difference between the cost per ton of the two grains, although corn has always been quoted at a higher figure. In order to test this matter an experiment was undertaken and continued far over six months, or through the entire laying season. Two small flocks of White Leghorn pullets, as nearly as possible of the same age and weight, were selected and treated exactly alike as regards housing and care, and both pens were fed the same kind and quantity of soft food for the morning meal. For the afternoon meal pen No. 1 was fed whole corn, while pen No. 2 received the same weight of whole wheat. Daily records were kept for the entire period of the experiments. A summary of the results showed the two grains had equal feeding value, thus indicating that the poultrymen should buy the cheaper grain, or, if the price were the same, use both.

Another successful experiment carried on at the station was the respective feeding of whole wheat and rolled barley to different pens. This trial was also made for the purpose of ascertaining the relative quantities of these two grains for feeding fowls. It was considered of special importance, on account of the difference in the cost of wheat and barley. If it could be proved that there was no material difference between the feeding value of the two grains, then the poultryman would save considerable were he to use barley with wheat, if the total substitution of the one for the other was not desirable. To carry on this experiment two

pens were selected. In each was placed twenty-five White Leghorn hens of same age (1 year) and weight. The details of the test were similar in all respects to the one just mentioned, with the exception that pen No. 1 was fed barley in the afternoon and pen No. 2 wheat. Careful daily records were kept and these proved conclusively that the egg yield from the pen fed barley was fully up to that of the wheat fed pen. After a certain length of time the conditions were reversed and the pen which had been receiving barley had wheat and vice versa.

Accurate records of the two pens again showed no advantage was gained by feeding wheat. The result of this experiment is very satisfactory and encouraging, in view of the higher cost of wheat. Naturally, if fowls are accustomed to wheat, it would be foolish to suddenly substitute barley, but on the other hand, a marked saving could be made if barley were fed in place of part of the wheat.

The question of "dry feeding" has caused considerable discussion during the past few months, both in the various poultry journals and at poultry association meetings. It appeared, therefore, that it was incumbent on the station to thoroughly test this method of feeding for the benefit of the poultrymen of the State. Accordingly, six pens of White Leghorn pullets have been selected. Three of the pens will be fed in the ordinary way and three in accordance with the new method. The details of this experiment will be published as soon as the results warrant. It is to be hoped that a favorable report may be made for the "dry feeding," as this plan saves much time, labor and inconvenience for the poultry feeders.

Experiments with moulting fowls were made during the past season, others are now being carried on. The object of such tests is to ascertain whether it is possible to hasten the moult and thus cause the fowls to start in laying sooner than when the ordinary method is followed. Several different plans have been proposed by poultrymen; among these is the "Van Dresser Method." Briefly this consists in withholding food wholly or in part for two weeks, which stops egg production and reduces the weight of the fowls, and then feeding a rich, nitrogenous ration suitable for the formation of feathers and general building up of the system. This plan was tried at the West Virginia station with apparent success. Trials by private parties have not been uniformly successful. This station received so many requests for information on this subject that it was considered best to conduct an experiment on "Forced Moulting" vs. the usual method. Two pens, therefore, of twenty-five fowls each were included in the test. Pen No. 1 was fed no mash and only a very little grain for two weeks, at the end of which time a very rich nitrogenous ration was given to the fowls. Pen No. 2 was fed as usual. Careful and accurate daily records were kept for four

Poultry Show Dates

Los Angeles, at Chutes Park, Jan. 6-12, 1908.—Second Annual Exhibition Breeders' Association of Southern California. Dr. Winslow, president; H. A. Meserve, secretary. Birds will be received January 1st. Judged by score card and awards read before public is admitted Monday, January 6th.

Pomona, Cal., Jan. 6 to 11, 1908.—First annual show of Pomona Poultry Association. Write C. C. McKey, 372 W. 2nd St., for remium list.

months, both as to the general health and egg yield of the two pens.

The details of this experiment are very interesting and valuable and will soon appear in bulletin form with those of the other experiments mentioned in this article. For the present it can be said that the forced moulting of the fowls was not a success; that is, pen No. 2 containing fowls fed in the usual way, yielded better results than did pen No. 1. The experiment under way includes four pens; pens Nos. 1 and 3 containing the same fowls experimented with last year, and pens Nos. 2 and 4 containing fowls one year younger. Pen. No. 1 is being treated according to the "Forced Method" of moulting; pens Nos. 2 and 3 are fed as usual. Pen No. 4 is receiving a richer nitrogenous ration than that fed to the others. The results up to date would tentatively seem to indicate that the best way to feed fowls, during the moulting period would be to materially increase the nitrogenous ingredients of the ration, preferably by the liberal use of bone-meal.

As stated above, the work accomplished at the Petaluma station has been, for the past year, mainly along the lines of feeding trials. At the laboratory at Berkeley the investigations have included a large number of analysis of foods and food products used by poultrymen, and the further study of many of the proprietary and condimental poultry foods found in the market.

Petaluma Poultry Show

The Petaluma Poultry Show certainly did herself proud and has much to be elated over in the success of the first show of the new Breeders' Association, not only in the size of the show—being the second largest show in the State so far this year—960 entries, but in attendance was more than expected. The prizes given were ample to go the rounds making every one perfectly satisfied and well paid for their trouble and expenses. Twenty-two cups and \$500 in cash prizes will be recognized by all breeders as well worth going after.

Of the many prize birds in the show the White Minorcas exhibited by H. C. Scrutton, president of the Coulson Poultry & Stock Food Co., attracted attention from all, and the prize cock bird brought down the handsome silver and bronze cup presented by Dodge, Sweeney & Co. for the best bird in the entire show and, when one considers the quality of birds represented at the show (some of which have taken prizes at many of the shows held in the State this year) will realize at once that a bird to carry off a prize with a demand for the best bird must have all the qualities to be able to win a trophy for the best bird with such competition to contend with. Mr. Scrutton's White Minorcas also won cock, 1, 2, 3; cockerel, 1, 2, 3; hen, 3, 4; pullet, 3; pen, 2.

Among the nameless was the Horned Barred Plymouth Rock exhibited by the Petaluma Incubator Co., and caused many queer remarks, which if jotted down would make no small book. Some of the Homer pigeons exhibited by L. C. Byce & Sons are birds with top notch records as long distance flyers.

The list of winners of prizes and cups given will furnish entertaining reading for all the fanciers throughout the State and it will give a good idea of what breeders must go against to win prizes at Petaluma, as most of the exhibitors are among the well-known and successful breeders in the State.

Mr. W. S. Sullivan of Agnew won on Buff Orpingtons; 4 firsts, 3 second and 4 third and two cups.

F. E. Baldwin, of San Jose, won on White Leghorns; 3 first, 3 second and silver cup for best display.

Mr. F. M. Newbert, of Sacramento, won on White Leghorns; 2 first, 3 third premiums.

Mr. V. G. Huntley, of Petaluma, who made the largest number of entries won 14 first, 4 second, 5 third, 3 fourth; \$10 for largest number of entries and three silver cups.

Stover Cup—For best collection of White Leghorns, F. E. Baldwin.

Wickersham Banking Co.—for best bird (opposite sex), J. M. Nelson.

McNear Cup—For best display in the show, V. G. Huntley.

Ten Dollars—For largest number of entries in the show, V. G. Huntley.

A Fancier's Cup—For Best display of Buff Orpingtons, W. S. Sullivan.

GOLD MEDAL AWARDED TO THE "SUCCESS MANURE SPREADER."

The old reliable Success Manure Spreader has just received another addition to its long list of honors. This time it is a testimonial from the Norfolk Exposition.

The manufacturer, the Kemp & Burpee Manufacturing Company, Syracuse, New York, have just received official notification that the Success Spreader has been awarded a gold medal by the Norfolk Jury of Awards.

The award is justly bestowed. The Success Spreader, formerly called the Improved Kemp Spreader, was the first really successful spreader manufactured. Among the many late comers it has continued to hold its own. It has made its way into all the states, and the yearly sales, instead of being lessened by reason of its many late competitors, are actually on the increase.

We congratulate the Kemp and Burpee people on the honor. Their machine has already been of incalculable benefit to farmers. The more Success Spreaders that find their way on to the farms, the better it will be for this country's soil and crops.

The one hundred premiums given away by the "Success" (no lamp) Incubator Co., of White Salmon, Wash., should interest every farmer as well as the poultrymen.

General Agriculture California Horticulturally

HOW TO MAKE THE BEST BACON.

Not only do my own people like the bacon that I cure better than any other they can get, but every guest we have ever had spoke of its high quality. As it is as easy to have good bacon as poor, I will give my formula for curing meat.

In the first place, medium-sized hams cure best and eat best. We prefer ours to be from ten to twelve pounds. Smaller ones may be as good but it is a waste to kill hogs that make smaller ones.

My hogs run on grass and clover pasture all summer, with a little corn fed, and in the fall on cowpeas. They keep fat and growing all the time, and need but little corn to finish off with.

We aim to have them weigh from 160 to 180 pounds when dressed. Don't like to have them any larger. We do not care to have very cold weather when we slaughter. In fact, do not care to have even freezing weather. We do not hang up the hogs to get cold after being killed, but cut up the meat and salt down while the animal heat is in it. The only objection to this is that the soft meat not yet stiff is harder to cut up in nice shape, but it salts better.

As soon as cut up we salt down. We use about the same proportion of fine salt, saltpeter and black pepper that most people do and we use no sugar. We do however, sweeten the meat with molasses. Our way is to lay down first the hams in a suitable box, with the skin side down. Over the flesh side of all these we pour first enough of the common black strap molasses to coat the flesh side all over, then rub it in with a large spoon, wooden paddle or corncob. Get all to stick on that we can, if not extremely thick and slow to run. After this is put on, we put on the salt mixture. Use a generous quantity, enough to cover the meat thoroughly and press it in with the hands. On the hams put a layer of shoulders, then sides and other parts, treating all the same way.

We leave the meat in the salt six

or eight weeks and then hang up in the smokehouse and smoke. We never use anything but hickory wood and we smoke it long and hard. Never less than six weeks, all day long and into the night and through all sorts of weather, cold or warm, wet or dry. The result is a flavor to the meat that everyone says is fine.

To keep out skippers we apply borax and sometimes wrap up the meat in paper and put in paper bags. Other ways are just as good. I think the fine flavor is due partly to the black strap molasses and to the long smoking with hickory. A little smoke only on the outside does not help the flavor.—G. B. M., in Farm Progress.

WHEN WE GET PARCELS POST—

You will send back that book you borrowed.

Mother will be able to send you a jar of jam without paying an express company dividend.

You can send real Christmas presents by mail.

The postman may bring you something besides circulars.

You can send a small package at small package rates.

You can send your laundry to be done up at home—if you are that kind of a fellow.

Your folks can fire it right back at you for you to have it done up yourself.

You can buy what you can't get in your home town without paying the express company more to carry it than its costs.—St. Louis Star-Chronicle.

PRUNE PLANTING IN SANTA CLARA VALLEY.

SANTA CLARA county and the valley of that name have never lost faith in prunes. Even during the dull period when it seemed as though there never would be a market for the fruit, land owners there continued planting prune trees. They seemed to have gotten into the habit of it. There has never been a year, since it was first discovered that prunes would do here, as nowhere else, that there has not been large additions to the acreage in prune orchards. This season the fruit has brought good prices, and while the crop has fallen very much below the normal, the growers have done well, as the demand has been good and prices high. At the present time preparations are being made for planting a very large new acreage, larger than in any one season for years past.

THE PEACH BLIGHT CAMPAIGN.

Active work is now under way in peach orchards of the State, which have shown evidence of peach blight during the past season. A very timely bulletin on this subject, prepared by Prof. Ralph E. Smith, has been issued by the University, and it should be in the hands of all growers of peaches. Peach blight, unlike pear blight, is a disease which is well un-

derstood and fully capable of prevention. The remedy is Bordeaux mixture, applied early in the season. Peach blight is a fungus disease, its spores are lodged on the twigs and branches of the tree and also on the ground beneath. These spores root as soon as weather conditions are favorable, and unless checked before they have taken root, it is practically impossible to destroy them with any ordinary remedy. By an early application of the Bordeaux, the spores are destroyed before they can obtain a root hold on the tree and the damage is averted. This has been the experience of all who have treated peaches for the blight, and invariably trees which were sprayed early in season, from the middle of November to the middle of December, and the sooner the better, have given a satisfactory crop and have been free from the disease while those which were neglected until late in the season have either little fruit or the crop has been a total failure. The time in which to fight this disease is getting short and unless already attended to, the work should be done immediately.

Kings county has received some shipments of peach trees from eastern nurseries, but they have been watched for indications of blight or any other disease.

TALLERDAY SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only way to Irrigate Allalfa. Cheaper than Flumes. This is only one of our specialties. We make Riveted Water Pipe in lengths of ten feet from single sheets. Let us prove to you that we make Pipe and Tanks right. WRITE FOR CATALOGUE.

Household Department

DECEMBER.

O month far famed! O days renowned!

Joy-fraught with hallowed benedictions crowned;
Life's yearly halting place for retrospective thought,
Where pensive memory calls back the smiles, the tears,
The joys, the hopes, the loves of vanished years,
And sighs to see the havoc, sad, that Time has wrought.

O hoary month! In regions of the North and East
The song of bird and rippling of the brook have ceased,
And Nature's thousand charms of summer days have fled.

There Boreas reigns, fierce god of wind and storms;
And Winter all of verdure into brown and white transforms
And leaves no trace of life and beauty sped.

O happy month! when keen anticipation, sweet,
Flies swift on wings of ardent love to greet
With gifts the friend, the lover or the kindred near.
As Winter closer draws his icy-fettered chains,
The heart expands and love unselfish reigns,
And speeds its lessons to the ones most dear.

Illustrious month! of most illustrious birth!
Good tidings, peace and joy to all the earth,
A heavenly choir announced when Christ was born.

No other birth such mighty portent bore,—
This Prince of Peace whom heaven and earth adore.
How thrills the heart at thought of Christmas morn!
—J. C. Oliver, Los Angeles.

The Orphaned Twins' Christmas Tree

Continued from Last Week

"Yes," answered his wife, hesitatingly, "everything so far as planned will be done by tomorrow night, when I get the doll's head sewed on and the clothes on her. But—"

"But what?" asked Mr. Baker, seeing his wife did not finish saying what was in her mind.

"Suppose we go a bit further and fix a Christmas tree?" she ventured.

"A Christmas tree? How—out of what?" asked the astonished Mr. Baker, who knew that such things as evergreen trees were scarce, and if one afforded the extravagance he must pay dearly, for such trees were shipped into the State from a great distance, thus enhancing their value.

"A little cottonwood," explained Mrs. Baker, working away on Tom's toboggan cap, which was all but complete. "I'll drape the bare branches and twigs with some cotton batting I have here to fill a comfortable with. It won't hurt the cotton, and it will make the tree look for all the world as if it were covered with snow."

"Say, that's just the idea," acquiesced her husband with new enthusiasm. "There's plenty of cottonwoods on the creek between here and town, and I'll cut a nice bushy sapling tomorrow as I come home. But wouldn't green tissue paper be better than cotton batting? I've seen folks use it that way when I was a youngster."

"I haven't the tissue paper, and I have the cotton," smiled Mrs. Baker. "Take what the gods supply and don't grumble," she added merrily. The next day—the Saturday before Christmas—Mr. Baker went to town. From store to store he went pricing

toys, for he had but 60 cents to spend, and he must stretch it all that it would stand. To his delight he found that the Christmas goods were all marked down for the closing out sale, for this was the last day of business for the merchants before Christmas, and the goods that were not sold today would lie on the shelves till another year rolled round. The doll's head—a fine, big china one, and just the fit for the body that awaited it—he purchased for 15 cents. And the bugle—think of it!—was got for 15 cents also. And what a blow it could make, too, for Mr. Baker tried the power of his lungs on it to make sure it was all right, for its drop from a quarter to 15 cents made him cautious.

"Now for the candy and nuts," he said to himself, as he hurried to a grocery store. There he bought half a pound of each, which took another 20 cents from the original 60 cents. And now everything was in his arms and he still had a dime of Christmas money in his pocket. "Ah, I have it!" he exclaimed inwardly. "I'll get the green tissue paper." Straight to a little milliner's shop he went (for he had read her advertisement and knew she carried a line of tissue paper) and soon he found the desired shade and asked the price. "Ten cents a dozen sheets," she informed him.

"One dozen, please," he ordered proudly, tossing the dime on the counter. Then he climbed into his wagon, pulled a blanket over his lap for warmth, and whistling gaily he started homeward. At the creek he stopped and cut the cottonwood sapling, trimmed off the top, and put it in the back of his wagon. Thus Mrs. Baker's plans were carried out to the letter, adding by way of a finishing touch the dozen sheets of green tissue paper.

Christmas morning came, and with its earliest streak of dawn Mr. and Mrs. Baker were out of bed and to the kitchen, where they viewed by dim daylight the monument of their last few days' labor. In the corner of the room farthest from the stove stood the Christmas tree, draped with green from trunk to topmost bough, with here and there flecks of white cotton that resembled snow. From the largest branches hung the few gifts, arranged in the best way to make a show. The two good souls had worked far into the night to complete the whole, having decided to let the children have the surprise when they came in to breakfast Christmas morning.

As Mr. and Mrs. Baker added a new touch here and there a knocking was heard at the kitchen door. Mr. Baker, opening it, found old Mr. Jamenson stamping off the snow on the step, his arms full of bundles.

"Well, howdy-do!" cried Mr. Baker, cordially. "Come in and smell the warmth. You must be cold—out in the frost so early."

While Mr. Baker placed a chair by the fire for the visitor he came in and deposited his bundles on the table. "Yep, neighbor," he said, "I'm almost turned to an icicle. But as I'm tryin' to play at Santa Claus a bit for the first time in my life—I reckon I mustn't complain about the cold. I was into Jones' store yest'day, an' see you a-gittin' them little tricks

for them kids, an' it sot me to think-in' a few thunks. Says I to me, if that poor chap can afford to spend a few cents that a-way I ort to throw in a few nickels myself to help along the pleasure of the orphans. So I pitched in and bought a little foolishness myself. But, say—" and his eyes fell on the Christmas tree—you've got a dandy there, but it needs more on it. Here, Mrs. Baker, undo them thare tricks an' hang 'em up."

Mrs. Baker obeyed, undoing the parcels one by one. First came a doll's house, complete with furniture; then a doll's trunk, filled with nuts, fruit and candy; a drum, a box of marbles, a Noah's ark, picture books, and a toy engine that wound up—all were laid out before the surprised and pleased Bakers. The last was a large, solid bundle, which Mrs. Baker took in her hands, and seeing something scrawled in a big, awkward hand across the wrapper, she involuntarily read it aloud. "For Missis Baker, with the kind wishes ov her nabor, old Jameson, esquire." On tearing away the paper a handsome dress pattern of black cloth, with linings and trimmings was disclosed. Before Mrs. Baker could speak her grateful feelings the queer visitor handed Mr. Baker a bit of paper, saying: "For your Christmas gift, neighbor." To the amazement of both the Bakers, they saw he had given over the \$60 note, receipted.

And who can picture the joy of Minnie and Tom when, after breakfast, the sheet that had been carefully drawn over the Christmas tree was taken down, leaving that wondrous thing of beauty before them?

And who can look into the hearts of the kind, unselfish foster parents, and the suddenly grown generous old neighbor, without also rejoicing in their happiness and Christmas cheer?

But this is not a story of grown-ups, so we draw the curtain on their part of the picture and return to the orphans. As soon as their first wonder was in a measure over their new mamma said: "Now my dears, you must thank our good friend here for much of this morning's pleasure and lovely presents."

And their thanks were profuse and heartfelt, for the little ones did not lack in feelings of gratitude. "I'm thankful for all my pesents, so I am," declared Tom, holding the drum proudly over his breast. "An' I'm thankful for such a good home and kind friends, too, so I am." Then he emphasized his thankfulness by blowing a shrill blast of his bugle, which he followed up with a loud beating of the drum. All held their ears shut and laughed gaily.

Then it was Minnie's turn to express herself. "I'm ever and ever so thankful for e-v-e-r-y-t-h-i-n-g, I am," she said, emphatically, hugging dolly to her heart. "I'm thankful for good Mr. Jameson and for my new papa and mamma, who's as good to us as our own dear papa and mamma were what's now in heaven."

"Amen," said old man Jameson, with a little quaver in his throat. And Mrs. Baker stooped, putting her arms round the twins, while her husband found it quite necessary to go to the window and look out at the sky.—Farm Sentinel.

A GOOD PAPER.

I think the Cultivator a good paper.—A. M. Mitchell, Redlands.

Don't Shiver

Just scratch a match—light the Perfection Oil Heater—and stop shivering. Wherever you have a room that's hard to heat—that the furnace doesn't reach—there you'll need a

UNITED STATES SEPARATORS

The Vermont Farm Machine Company, of Bellows Falls, Vt., is sending out a beautiful booklet of over 50 pages illustrated in colors and with fine half tone engravings, which shows the various working parts, a view of the factory, and pretty nearly everything about a cream separator that a dairymann would like to know. Anyone who will say that they saw it in the Cultivator, and will write to the firm mentioned will be able to secure this booklet.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Dec. 24, 1907.

Butter.

As suggested last week, butter has made a good advance during the week and now stands with extra creamery at 75 cents. But it is plain that the increased price has lessened the consumption and the tone of the market is not at all strong. The storage and lower grades stand at the same quotations as last week.

Creamery extra per roll.....75
Firsts.....57½@60
Seconds.....60

FINE STOCK

J. Crouch & Son, proprietors of the LaFayette Stock Farm, Lafayette, Indiana, are shipping to the Coast a new importation of Percheron and Belgian stallions, all of which showed at the International Stock show at Chicago, December 2nd to 8th.

They have been exceedingly fortunate this year in exhibiting their stock at the different State fairs, viz: Ohio State Fair, at Columbus, Ohio; Indiana State Fair, Indianapolis, Ind.; Illinois State Fair, Springfield, Ill.; Missouri State Fair, Sedalia, Mo.; and the American Royal at Kansas City, winning 82 firsts, 52 seconds, 29 thirds making a grand total of 163 prizes.

They announce through their agent, Mr. J. F. Campbell, manager of their Sacramento stables, an exceptional business during the past few months and feel much encouraged at the outlook for the coming season, showing that the breeders of coach and draft horses in California are constantly looking for good stock and the time is not far off when the effects of the German coach, Percheron and Belgian stocks will be more prominent in California.

Their stock can be seen at their stables at the State Fair grounds at Sacramento at all times.

The stock exhibited by this firm at the California State fair this last September attracted a great deal of attention and shows conclusively that Mr. Campbell has a fine bunch of stock at his Sacramento stables. An illustration of some of the finest of it appeared in the Cultivator in the issue which appeared at the time of the fair.

San Francisco Markets

SAN FRANCISCO, Dec. 24.

Butter.

Butter advanced and declined during the week. The market is now weak in tone and while higher than a week ago is weak and may decline still ore.

The current prices on dairy products in San Francisco are always from 2 to 3 cents higher than the rates given in the daily official list of the Wholesale Dairy Produce Exchange. The retail dealers in this city invariably pay an additional 2 cents per pound on butter and per dozen of eggs, and occasionally it is 3 cents. In cheese the increase is 1 cent per pound. By making these additions to the Dairy Exchange prices the producer in the country can always determine the actual prices ruling in this city. The quotations as prepared by the San Francisco Wholesale Dairy Exchange yesterday were as follows:

California extras per lb.40

Peets.....2.25@2.50

Vegetables.

The vegetable market is necessarily let on account of the limited receipts in most descriptions. Green beans are the most abundant variety, but they are augmented daily by canners that are practically unsaleable. String beans cleaned up briskly at a bit a pound and a firm inquiry for them throughout the day. The holiday demand is helping out on the lines. Potato market is yet weak and lower.

Hay.

Regarding hay shipments, Somers & Co. says: "There has been a material diminution in hay shipments during the past week, the total showing 3360 ton in comparison with 5170 for the week preceding. This has been as a matter of necessity for the market could not continue to absorb hay in such quantities as was being shipped nor are there a sufficient number of hay wagons in town to properly unload such heavy arrivals. The only feature of the market at the moment is its dullness. Values are considerably disturbed and although most receivers are endeavoring to maintain prices, yet material cuts in prices are being made continually by some receivers in order to effect sales. Shipping conditions are somewhat reversed, for although the market was very largely supplied by schooners a short time ago, yet now most of these have been laid off and the bulk of the present arrivals are by rail."

Citrus Market

LOS ANGELES, Dec. 24, 1907.

Oranges have gone forward liberally during the holiday season, more liberally than before, and yet the increased quantity has been absorbed at very satisfactory. Shipments are now much lighter and will continue light till the demand increases.

Lemons are in the dumps waiting either colder or warmer weather in the East. Some foreigners are coming in, but the few Californias supply most of the demands.

Total shipments to date are 1857 of which 518 were lemons. Same date last year 1316 cars, of which 330 were lemons.

NEW YORK, Dec. 23.—Market is stronger and higher on best fruit. Easier and lower on lemons. Weather unfavorable. It is raining. Twenty cars of navel, four cars of lemons and one car of Arizona sold.

The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine straight ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gauge depth to which moldboard should cut. It's a very desirable machine for road-building in city or village. It makes good roads and keeps them so. Although made of steel and malleable iron, still it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveeing, Foundation-digging.

For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet, "Delightful Roads." It's free and tells you all about the 20th Century.

The Harris Air Pump Company's Twentieth Century Air Lift

For the Atlas-Lion Air Lift Water Co., where we installed four pumps, from one well we pumped 48 inches with the Harris Air Lift, as compared to 30 inches by the old system, using the same power. Records of tests and cuttings mailed upon request. Completed plants installed. Air compressors, engines and pumps.
